# Executive Summary

## Clinical Trials in Texas

- Biopharmaceutical research companies are conducting or have conducted more than 8,200 clinical trials of new medicines in collaboration with the state's clinical research centers, university medical schools and hospitals (1999 to present).

*Freedom fuels innovation, and through our proud tradition of bold thinking and personal freedom, Texas is a natural fit for industries looking to create cutting-edge treatments, develop cures and improve lives. I'm proud of Texas' ranking in clinical studies, and believe our state has the workforce, talent, universities and business climate to become a national leader for biotech research, development and commercialization.*

—Governor Rick Perry

- Of the more than 8,200 clinical trials, more than 4,300 target the nation's six most debilitating chronic diseases—**asthma, cancer, diabetes, heart disease, mental illnesses and stroke.**

## Economic Benefits of Clinical Trials in Texas

- Biopharmaceutical research companies have been an important source of jobs, tax revenue and research spending in Texas.
- The 2012 *Texas Biotechnology Industry Report* from the Office of Governor Rick Perry found that about 125 biopharmaceutical companies have created a large pharmaceutical manufacturing workforce, employing more than 9,500 in Texas, making it one of the top 10 states in the nation for pharmaceutical manufacturing jobs.
- In 2010, the total value of Texas pharmaceutical shipments exceeded \$4.7 billion, with manufacturers making total capital investments of nearly \$100 million, according to the U.S. Census Bureau.
- Texas is also a leading pharmaceutical research state. In 2012, Texas was ranked second nationally for the number of all clinical trials, with more than 14,000 studies underway, according to the National Institutes of Health database [www.clinicaltrials.gov](http://www.clinicaltrials.gov).
- Since 2005, the Texas Emerging Technology Fund (TETF) has invested over \$130 million in pharmaceutical-related startups. Funded companies have developed a wide range of technologies, including treatments for cancer, liver disease and obesity.
- Public investment in research and development (R&D) is supported by the state's vast network of public universities and health-related institutions. In 2010, Texas public institutions of higher education

*“The clinical trials of new medicines conducted by companies in Texas have been an especially important development for chronic disease patients in the state and all over the country—nearly 4,400 of the trials pursued by biopharmaceutical firms in the Lone Star State have been aimed at cancer, diabetes, heart disease, stroke, mental illnesses and asthma, the nation’s six most debilitating chronic conditions, which have wreaked havoc in Texas. Cancer alone will kill nearly 37,000 Texans this year and about 10 percent of the state’s adults—1.8 million people—are diabetics.”*

—Thomas R. Kowalski, President, Texas Healthcare & Bioscience Institute

*“In a nutshell, clinical trials of new drugs have been beneficial to patients, the state’s economy and the advance of science. The trials account for 45 to 75 percent of the average \$1.2 billion cost of developing one new drug and biopharmaceutical companies generally hire local institutions to do this challenging clinical research work. What’s more, it is significant, and certainly exciting, that a respectable number of drugs tested in Texas over the last 13 years have been new-generation biotechnology treatments, which have the strong potential to be more effective medicines and some of them could improve our ability to predict and even prevent disease.”*

—Bill Hammond, President and Chief Executive Officer, Texas Association of Business

invested more than \$2.5 billion on medical and life sciences research, accounting for 61 percent of all higher education R&D expenditures in the state.

- The private sector also has invested in R&D in Texas with 850 private scientific R&D companies employing more than 21,300 workers.
- In addition to R&D facilities, Texas has more than 2,000 medical and testing laboratories, which include blood, pathology, imaging, diagnostics and device testing facilities, employing more than 32,200 workers.
- Company employees in Texas include life sciences researchers, management executives, office and administrative support workers, production workers, engineers, architects, computer and math experts and sales representatives.

- Clinical tests of new drugs are conducted in three phases and account for an average of seven of the 10 to 15 years it takes to bring a new drug from development to patients.
- Clinical trials for a given drug or treatment involve thousands of volunteer patient participants, and the generation of tens of thousands of pages of technical and scientific data.
- Clinical trials are responsible for 45 to 75 percent of the \$1.2 billion average cost of developing one new cutting-edge biotechnology medicine.

## About Clinical Trials

- In the development of new medicines, clinical trials are conducted to prove therapeutic safety and effectiveness and compile the evidence needed for the Food and Drug Administration (FDA) to approve treatments.

*“Clinical trials are a critical resource for the discovery of life saving drugs and the development of improved diagnostic, prevention and treatment methods. Texas’ ethnic, racial and cultural diversity offers pharmaceutical companies the opportunity to ensure adequate representation of diverse participants and generalizability of trial results. We need to find better ways of communicating with patients, doctors and advocacy groups about new and open clinical trials in our Texas communities. Clinical trials can be an important therapeutic option for patients suffering from chronic disease and should be a topic of discussion between those patients and their doctors.”*

to make existing approved drugs more effective and easier to use with fewer side effects.

- All clinical trials must be reviewed and approved by an Institutional Review Board (IRB), an independent committee of physicians, statisticians, local community advocates and others to ensure a trial is ethically conducted and patient rights are protected.
- Clinical trial progress reports must be submitted at least annually to the FDA and IRB.
- All facilities that conduct or support biomedical research involving patients must comply with federal regulations and have an IRB.

## Clinical Trials and Chronic Diseases

- Chronic diseases pose the greatest threats to our nation’s health and our ability to treat and prevent medical conditions.
- According to the Centers for Disease Control and Prevention, today, in the United States:
  - Patients with chronic diseases account for 75

cents of every dollar spent on health care.

- Chronic diseases are the **leading cause of death and disability**.
- Chronic diseases are a **leading driver of rising health care costs** with expenses totaling billions of dollars every year.
- Biopharmaceutical research companies are developing new medicines to help treat those conditions that are taking an unprecedented toll on American lives, and many of these medicines are being tested today in clinical trials throughout Texas.
- Since 1999, biopharmaceutical research companies are sponsoring or have sponsored 4,390 clinical trials of potential new medicines in Texas alone for **asthma, cancer, heart disease, stroke, diabetes and mental illnesses**. Of these trials, 914 are either not yet recruiting or are just now seeking Texas patients.
- Many of the state’s clinical tests involve collaborations with such respected local institutions as the **University of Texas Health Sciences Centers** and **Texas A&M University School of Medicine**.
- Many of the medicines being clinically tested here are new-generation biotechnology treatments.

# Clinical Trials in Texas

Clinical tests of new medicines are a vitally important part of the drug development and approval process—they account for 45 to 75 percent of the \$1.2 billion average cost of developing a new drug and are conducted to determine the safety and effectiveness of that treatment in patients.

Some trials are also conducted to compare existing treatments and some are done to learn if a drug is appropriate for a different patient population, such as children. Still others are conducted to find ways to make existing approved drugs more effective and easier to use with fewer side effects.

It's essential that trials be conducted properly so that clinicians and drug reviewers can develop accurate assessments of the efficacy and safety of medicines when used by patients. The FDA is a vigilant regulatory agency and its pharmaceutical review officers are effective in detecting flawed information.

Questionable or confusing data can lead to lengthy delays in product approval or outright FDA rejection of a new drug.

Biopharmaceutical research companies are looking for the best physicians and research institutions to meticulously help design and conduct their clinical trials to determine whether a medicine is safe and effective. Side effects must be painstakingly documented and a determination made as to whether they occur too often and are dangerous.

Clinical tests involve three phases and thousands of volunteer patients and are often conducted at multiple sites around the country. In Texas, biopharmaceutical companies are providing funds to have trials conducted at the states' well-respected university medical schools and science centers, local hospitals and clinical research organiza-

# New Generation Medicines in Development

Many of the medicines being tested in Texas are cutting-edge biotechnology drugs.

America's biopharmaceutical research companies are using biotechnology to develop hundreds of medicines and vaccines today. And Texas is one of the states where new-generation research and development work is being done.

Through biotechnology, new ways are being developed to not only more effectively treat disease, but also to predict it and eventually prevent it.

Biotechnology medicines are developed through biological processes using living cells or organisms, rather than traditional chemical synthesis, the mainstay of pharmaceutical development for decades.

Such novel treatments use a variety of new approaches to treat disease. For example, a monoclonal antibody is a laboratory-made version of the naturally occurring immune system protein that binds to and neutralizes foreign invaders. Interferons are proteins that interfere with the ability of a cell to reproduce.

Antisense drugs, meanwhile, are medicines that interfere with the communication process that tells a cell to produce an unwanted protein. In addition, nanotechnology is being used in biotechnology research to provide drug-delivery systems, new treatments and diagnostics.

Many of the medicines in clinical testing at Texas medical schools and research centers feature these technologies. For example:

- A genetically-modified virus-based vaccine to treat melanoma.
- A monoclonal antibody for the treatment of cancer.
- An antisense medicine for the treatment of cancer.
- A recombinant fusion protein to treat diabetic macular edema.
- A monoclonal antibody in the pipeline targets lupus and various types of cancer.
- A therapeutic vaccine, designed to jump-start the immune system to fight disease, is in development for lung cancer and melanoma.

These are only a portion of the examples of new ways the nation's biopharmaceutical companies and Texas research institutions are working together to attack disease. The biotechnology medicines and vaccines in development are helping to expand the frontiers of science and potentially bring more and better treatments to patients.

# Conclusion

Biopharmaceutical companies' close collaboration with clinicians and research institutions in Texas benefits patients, the state's economy and the advancement of science and patient care. Clinical trials provide stimulating biopharmaceutical research work and a reliable source of revenue for the state's university medical schools and science centers, hospitals and clinical organizations and the medicines being tested

are often cutting-edge cell and protein treatments with the potential to be safer and more effective than older chemical compound drugs.

What's more, Texans considering participation in clinical trials of new drugs have a wide range of choices, including 914 tests of new medicines for the six most debilitating chronic diseases in America.

## The Drug Discovery, Development and Approval Process

It takes 10-15 years on average for an experimental drug to travel from the lab to U.S. patients. Only five in 5,000 compounds that enter preclinical testing make it to human testing. One of these five tested in people is approved.

Clinical Trials						
	Discovery/ Preclinical Testing	Phase I	Phase II	Phase III	FDA	Phase IV
Years	6.5	1.5	2	3.5	1.5	
Test Population	Laboratory and animal studies	20 to 80 healthy volunteers	100 to 300 patient volunteers	1,000 to 3,000 patient volunteers	Review process/ approval	Additional post-marketing testing required by FDA
Purpose	Assess safety, biological activity and formulations	Determine safety and dosage	Evaluate effectiveness, look for side effects	Confirm effectiveness, monitor adverse reactions from long-term use		
Success Rate	5,000 compounds evaluated	5 enter trials			1 approved	

## The Drug Development and Approval Process

**The U.S. system of new drug approvals is perhaps the most rigorous in the world.**

It takes 10-15 years, on average, for an experimental drug to travel from lab to U.S. patients, according to the Tufts Center for the Study of Drug Development. Only five in 5,000 compounds that enter preclinical testing make it to human testing. And only one of those five is approved for sale.

On average, it costs a company \$1.2 billion, including the cost of failures, to get one new medicine from the laboratory to U.S. patients, according to a 2007 study by the Tufts Center for the Study of Drug Development.

Once a new compound has been identified in the laboratory, medicines are usually developed as follows:

**Preclinical Testing.** A pharmaceutical company conducts laboratory and animal studies to show biological activity of the compound against the targeted disease, and the compound is evaluated for safety.

**Investigational New Drug Application (IND).** After completing preclinical testing, a company files an IND with the U.S. Food and Drug Administration (FDA) to begin to test the drug

in people. The IND shows results of previous experiments; how, where and by whom the new studies will be conducted; the chemical structure of the compound; how it is thought to work in the body; any toxic effects found in the animal studies; and how the compound is manufactured. All clinical trials must be reviewed and approved by the Institutional Review Board (IRB) where the trials will be conducted. Progress reports on clinical trials must be submitted at least annually to FDA and the IRB.

**Clinical Trials, Phase I**—Researchers test the drug in a small group of people, usually between 20 and 80 healthy adult volunteers, to evaluate its initial safety and tolerability profile, determine a safe dosage range, and identify potential side effects.

**Clinical Trials, Phase II**—The drug is given to volunteer patients, usually between 100 and 300, to see if it is effective, identify an optimal dose, and further evaluate its short-term safety.

**Clinical Trials, Phase III**—The drug is given to a larger, more diverse patient population, often involving between 1,000 and 3,000 patients (but sometime many more thousands), to generate statistically significant evidence to confirm its

safety and effectiveness. They are the longest studies, and usually take place in multiple sites around the world.

**New Drug Application (NDA)/Biologic License Application (BLA).** Following the completion of all three phases of clinical trials, a company analyzes all of the data and files an NDA or BLA with FDA if the data successfully demonstrate both safety and effectiveness. The applications contain all of the scientific information that the company has gathered. Applications typically run 100,000 pages or more.

**Approval.** Once FDA approves an NDA or BLA, the new medicine becomes available for physicians to prescribe. A company must continue to submit periodic reports to FDA, including any cases of adverse reactions and appropriate quality-control records. For some medicines, FDA requires additional trials (Phase IV) to evaluate long-term effects.

Discovering and developing safe and effective new medicines is a long, difficult, and expensive process. PhRMA member companies invested an estimated \$49.5 billion in research and development in 2011.
