Re: Request for Comments on Significant Foreign Trade Barriers for the 2023 National Trade Estimate Report, 88 Fed. Reg. 62,421 (September 11, 2023)

Dear Ms. Buffo,

On behalf of the Pharmaceutical Research and Manufacturers of America (PhRMA), I am pleased to submit the attached comments regarding significant foreign trade barriers to U.S. exports for 2024 reporting.¹ In submitting these comments, we aim to assist the United States Trade Representative (USTR) and the Trade Policy Staff Committee in identifying significant foreign trade barriers for inclusion in the 2024 National Trade Estimate (NTE) Report.

PhRMA member companies are devoted to inventing, manufacturing and distributing valuable medicines that enable people to live longer, healthier and more productive lives. The U.S. biopharmaceutical industry is the world leader in medical research – producing more than half the world’s new molecules in the last decade. This pioneering work by U.S. biopharmaceutical innovators contributes significantly to economic growth and supports good-paying jobs in all 50 states. As a key component of America’s high-tech economy, the research-based biopharmaceutical sector supports over 4.4 million jobs across the economy, including more than 900,000 direct jobs, and contributes more than $1.4 trillion in economic output on an annual basis when direct, indirect, and induced effects are considered.²

Our sector also continues to be one of the most research-intensive, manufacturing-intensive and export-intensive in America. Since 2000, PhRMA member companies have invested more than $1.1 trillion in the search for new treatments and cures, including

¹ The specific markets included in our submission are Algeria, Argentina, Australia, Brazil, Canada, Chile, China, Colombia, Egypt, the European Union, India, Indonesia, Japan, Korea, Malaysia, Mexico, New Zealand, the Philippines, Russia, Saudi Arabia, Singapore, Taiwan, Thailand, Turkey, the United Arab Emirates, the United Kingdom and Vietnam.
more than $101 billion in 2022 alone.\(^3\) In 2022, U.S. biopharmaceutical goods exports exceeded $89 billion.\(^4\) The biopharmaceutical sector was the largest exporter of goods among the most R&D-intensive industries in 2020 – which in addition to biopharmaceuticals included navigational equipment, semiconductors and other electronic components, medical equipment and supplies and communications equipment.\(^5\) The U.S. biopharmaceutical industry also is among the top five employers of U.S. manufacturing jobs, with more Americans directly employed in pharmaceutical manufacturing than in manufacturing in several other manufacturing industries, including each of the following: iron and steel products, aerospace products and parts, petroleum and coal products, and electric equipment and appliances.\(^6\)

At the same time, our members face enormous challenges. The process of discovering and developing a new medicine is long, complex, and costly. Today, bringing a new medicine from concept to market can take an average of 10-15 years. As a result, the average cost to develop a new medicine has grown from $179 million in the 1970s\(^7\) to an average $2.6 billion today including the cost of failures,\(^8\) with overall development costs more than doubling in the last decade due to growing complexities.\(^9\) The risks involved in developing new drugs are also substantial. For every single medicine approved by the FDA, tens of thousands of compounds have been screened during the research and development process. Even medicines that reach clinical trials have less than a 12 percent chance of being approved,\(^10\) and only two out of 10 approved drugs produce revenues that match or exceed average research and development costs.\(^11\)

\(^5\) Analysis of National Science Foundation and Business Research and Development Survey (BRDIS) data by ndp | analytics.
\(^9\) Previous research by DiMasi and Grabowski estimated average R&D costs in the early 2000s at $1.2 billion in constant 2000 dollars (see DiMasi JA, Grabowski HG. The cost of biopharmaceutical R&D: is biotech different? Managerial and Decision Economics. 2007;28: 469-479). That estimate was based on the same underlying survey as the author's estimates for the 1990s to early 2000s reported here ($800 million in constant 2000 dollars) but updated for changes in the cost of capital.
\(^10\) Supra n. 8.
the approximately 1,200 biopharmaceutical companies in the United States, more than 90 percent do not earn a profit.12

The attached submission outlines the principal trade barriers that our member companies face worldwide and identifies concrete actions that the U.S. Government can take to address these barriers. Per your request, the submission is divided into market-specific files. The challenges are many, especially as America’s innovative pharmaceutical industry continues to actively battle COVID-19 and other diseases, but vigilance and perseverance are the only options to maintain the strength of America’s biopharmaceutical industry – the world’s engine for medical innovation.

The Medicare Prescription Drug, Improvement, and Modernization Act of 2003 called for the Administration to develop a strategy to address foreign government price controls on pharmaceuticals and related practices through bilateral and multilateral trade negotiations. PhRMA believes that the cornerstone of any such strategy must be a proactive U.S. trade policy focused on addressing government price controls and related practices and highlighting the global benefits for patients from the potential groundbreaking research that could result from a reduction in key trade barriers. Unfortunately, foreign government pricing and reimbursement policies around the globe over the last year have continued to have a deleterious impact on both U.S. innovators and patient access to innovative medicines.

In its 2021 Special 301 Report, USTR noted the need for the United States to “establish or continue dialogues with trading partners and others to encourage a common understanding on questions related to innovation and pricing in the pharmaceutical … sector[]” and the need to “promote fair and transparent policies in th[is] sector[].” PhRMA encourages USTR to enhance these efforts, as it is critical that the U.S. Government engage on these issues with its wealthiest trading partners taking advantage of U.S. innovation (e.g., Australia, Canada, Europe, Japan and Korea), and to require immediate and meaningful steps that more fully recognize innovation in government pricing and reimbursement and related market access policies.

PhRMA also is particularly alarmed by the compulsory licenses granted in recent years in Malaysia, Indonesia and Russia and by drastic proposals to expand compulsory licensing in several markets, including Brazil, Colombia and the European Union. Such damaging actions have broken or would break patents that protect valuable treatments and cures developed in the United States. In its 2020 Special 301 Report, USTR raised “serious concerns” about compulsory licensing, including its use as a tool to exert undue leverage in pricing negotiations, and pledged to “monitor developments” and to “engage, as appropriate, with trading partners.” Such engagement is sorely needed now.

Unfortunately, compulsory licensing often is used to achieve national industrial policy goals. We remain particularly concerned that many World Trade Organization (WTO) Members are implementing industrial policies, including local manufacturing requirements and discriminatory intellectual property regimes, that discriminate in favor of domestic companies and thus inhibit our industry’s ability to compete globally. Many of these policies appear to breach obligations under international treaties, e.g., the General Agreement on Tariffs and Trade and the WTO Agreements on Technical Barriers to Trade, Trade-Related Aspects of Intellectual Property Rights (TRIPS), and Trade-Related Investment Measures.

In addition, numerous markets fail to provide adequate protection of our members’ intellectual property rights. WTO Members, pursuant to the TRIPS Agreement, are obligated to establish functional intellectual property protection systems. Such systems must provide strong patent protection and safeguard test and other data against disclosure and unfair commercial use. In particular, this data should not be used prematurely to support other applications for marketing approval by competitors. PhRMA urges enhanced U.S. advocacy abroad to promote strong intellectual property rights and effective patent and data protection regimes that are essential to promoting clinical research.

The reduction and elimination of trade barriers is for the benefit of patients, for whom increased trade liberalization by U.S. trading partners will lead to greater access to life-saving and life-enhancing new medicines. PhRMA member companies are actively engaged in helping to solve health problems in both developed and developing countries, and America’s research-based biopharmaceutical companies are among the largest funders of the research and development necessary to cure such major diseases as malaria, tuberculosis, sleeping sickness and dengue fever. However, these efforts are seriously threatened by the erection of market access barriers, the erosion of intellectual property protections, and the undermining of incentives to innovate new medicines.

PhRMA appreciates the opportunity to contribute to the 2024 NTE. We commend any efforts by USTR, the Department of Commerce, the Department of State, and other agencies within the Administration to make progress toward eliminating discriminatory and trade-restrictive barriers to U.S. exports of biopharmaceuticals and strengthening intellectual property protections abroad.

Please do not hesitate to contact me if you have any questions regarding the content of PhRMA’s submission.

Sincerely,

/s/

Jay T. Taylor

PhRMA 2024 NATIONAL TRADE ESTIMATE OVERVIEW

The Pharmaceutical Research and Manufacturers of America (PhRMA) appreciates the opportunity to provide this submission for the 2024 National Trade Estimate (NTE) Report. America leads the world in the research and development of valuable new medicines and vaccines. The NTE Report provides the Administration with a critical opportunity to confirm its strong commitment to defend these and other American inventions in overseas markets and is a critical tool to address damaging market access and intellectual property barriers abroad that harm America’s innovative and creative industries and the more than 45 million jobs that they support across the country.\(^{15}\)

The COVID-19 pandemic rattled health systems and economies globally, but the biopharmaceutical industry worked around the clock to diagnose, treat and prevent infections from the virus and other conditions. Indeed, in 2022 alone, PhRMA member companies invested nearly $101 billion in research and development (R&D) to facilitate new ways to tackle some of the most complex and difficult to treat diseases of our time.\(^{16}\) In addition, the biopharmaceutical industry has provided financial support and in-kind donations to organizations and collaborated with the United States (U.S.) and global health authorities to combat the pandemic. Now that the pandemic is behind us, it is critical that the existing resilience and diversity of the biopharmaceutical industry’s global supply chains be maintained. Despite unprecedented logistical challenges and increases in demand, the United States did not experience significant supply shortages for innovative biopharmaceuticals during the pandemic – a testament to the efficiency and delivery of industry’s complex and carefully developed supply chains. In order to further strengthen supply chain resilience and better prepare for future challenges, efforts should be taken to enhance regulatory capacity and cooperation, leverage R&D and manufacturing infrastructure to expand production capacity, facilitate the free movement of pharmaceuticals and inputs, and strengthen cybersecurity infrastructure.

Durable intellectual property and market access policies made possible the tremendous R&D effort required to innovate and manufacture COVID-19 diagnostics, treatments and vaccines for the world. As a result of the unprecedented collaboration and partnerships between the private sector, researchers, academia, governments and other organizations – including over 140 voluntary manufacturing and licensing agreements – biopharmaceutical manufacturers delivered numerous COVID-19 treatments and vaccines in record time.\(^{17}\)

---

These successful efforts by America’s innovative biopharmaceutical industry ultimately led to the global conclusion of the COVID-19 public health emergency. On April 10, 2023, President Biden signed into law H.J.Res. 7, which terminated the national emergency related to the COVID-19 pandemic,\(^\text{18}\) and on May 5, 2023, the World Health Organization declared an end to the COVID-19 public health emergency.\(^\text{19}\) Despite this major accomplishment by American scientists, researchers and manufacturers – underscored by the recent Nobel prize award to two of the scientists engaged in the critical mRNA research – the Administration agreed to waive obligations to protect intellectual property rights under the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) for COVID-19 vaccines – a harmful and unnecessary decision.\(^\text{20}\) This “TRIPS waiver” decision was made despite the fact that TRIPS rules were essential to incentivize the development of vaccines, as well as the fact that a global surplus of vaccines existed at the time of the decision – and still does. This policy position constitutes a reversal of longstanding U.S. policy under both Democratic and Republican Administrations concerning the protection of American intellectual property rights from unfair use by foreign competitors.

Moreover, the Administration’s support for the TRIPS waiver was offered absent any evidence that waiving international obligations would promote the development or manufacturing of additional COVID-19 vaccines. In fact, intellectual property rights were never a barrier to access but rather enabled the very collaborations among manufacturers and suppliers that were necessary to produce vaccines on a global scale. Indeed, experience demonstrated that weak health systems, inadequate infrastructure and last-mile distribution and administration challenges unrelated to intellectual property protection – such as cold storage, transportation and health workforce barriers – impeded the global response to the pandemic.\(^\text{21}\) Reports indicated that countries destroyed vaccines because the countries were unable to distribute the vaccines within their shelf life or requested that manufacturers suspend delivery of vaccines because the countries had enough stock.\(^\text{22}\)

Despite these facts, the Administration supported the TRIPS waiver efforts of foreign governments historically and consistently opposed to the TRIPS Agreement specifically and the global intellectual property system more broadly. This decision undermined our global response to the pandemic – with tragic consequences for people in countries throughout the world – by distracting attention and resources from addressing actual barriers to global vaccination. Having produced more than enough doses to vaccinate the world, the innovative biopharmaceutical industry encouraged the Administration to demonstrate leadership at the WTO by opposing the TRIPS waiver and refocusing global attention to resolving international challenges to distributing and administering that global vaccine surplus. Instead, the Administration prioritized the domestic political objective of attacking intellectual property rights and joined foreign governments in championing the TRIPS waiver, to the detriment of American innovation and global public health. Waiving global obligations to protect American intellectual property rights compromises safety, weakens supply chains and fosters the proliferation of counterfeit vaccines.

In addition, the Administration’s decision to effectively hand over American innovations to countries looking to undermine U.S. leadership in biomedical discovery runs counter to the Administration’s stated objectives concerning the growth of American infrastructure, innovation and employment. It also further alienated allied economies that support strong IP policies abroad and provided the political cover for other governments to advance legislation eroding national IP systems. Any effort to cede American intellectual property to foreign countries is an effort to undercut American innovation and send American research and manufacturing jobs overseas.

As the United States and other WTO Member States continue to consider whether to expand the TRIPS waiver to diagnostics and therapeutics, the innovative biopharmaceutical industry encourages the Administration and serious policymakers everywhere to reject any expansion of the TRIPS waiver. On December 16, 2022, the United States Trade Representative (USTR) requested the United States International Trade Commission (USITC) to investigate a series of questions related to COVID-19 diagnostics and therapeutics, and that report was made public on October 17, 2023. As that report demonstrated, the COVID-19 public health emergency is over, and an abundance of affordable – and often free – COVID-19 medicines exist throughout the world. For example, as highlighted in the report, more than 4 billion people from 119 countries have access to COVID-19 therapeutics through the Medicines Patent Pool. At a time when research and development has never been more important, our industry hopes that all governments and stakeholders will move beyond this ideological debate.

---

and refocus on the shared objectives of solving real global health challenges and ensuring that global policies promote innovation.

The United States leads the world in the research and development of valuable new medicines and vaccines. However, foreign trading partners that deny adequate and effective protection of intellectual property rights, or deny fair and equitable market access, significantly threaten the ability of our member companies to develop and export life-saving treatments and cures. Such policies put at risk nearly $80 billion of American biopharmaceutical exports and more than four million jobs across all 50 states. The NTE Report provides the Administration with an important opportunity to confirm its strong commitment to defend American inventions in overseas markets and a critical tool to address damaging market access and intellectual property barriers abroad that harm America’s innovative and creative industries and the significant exports that they generate. In order for the U.S. biopharmaceutical industry to continue innovating and delivering innovative medicines to patients globally, the Office of the U.S. Trade Representative (USTR) must address the many significant trade barriers that foreign governments impose against biopharmaceuticals innovated and manufactured in the United States.

Urgent action is required to address serious market access and intellectual property barriers in the overseas markets named in this submission. As explained further below, biopharmaceutical innovators in the United States face a wide array of damaging government pricing policies abroad that undervalue American innovation, threaten billions of dollars in lost sales and put American competitiveness, jobs and exports at risk. Medicines discovered and manufactured by PhRMA member companies are the constant target of compulsory licensing and other harmful practices that deny the most basic intellectual property protections necessary to drive discovery and bring new treatments and cures to patients around the world.

USTR and other federal agencies should prioritize action to address compulsory licensing threats, including in Brazil, Colombia, Indonesia and Malaysia and to end egregious and discriminatory pricing policies in several markets, including Canada, Japan and Korea. Government price controls imposed in many markets are non-tariff barriers to trade that substantially eliminate incentives to invest in the development of new medicines for patients. They deny American inventors and workers the ability to compete on fair and equitable terms in foreign markets, undermine the expected benefit of intellectual property protections and exacerbate the U.S. trade imbalance by inappropriately raising barriers in their own markets, while their own inventors enjoy access to the U.S. market. Ending damaging pricing policies in these markets and others could add billions of dollars to research and development for new medicines and lower overall health care costs in the United States and around the world, while supporting U.S. competitiveness and jobs.26

I. The Innovative Biopharmaceutical Sector

The U.S. biopharmaceutical industry is the world leader in medical research. Innovators in this critical sector depend on strong intellectual property protection and enforcement, and on fair and equitable access to overseas markets. With the right policies and incentives in place at home and abroad, they can continue to bring valuable new medicines to patients, contribute powerfully to the American economy and jobs and open markets to U.S. exports.

A. Biopharmaceutical innovation delivers value for patients and economies

PhRMA member companies are devoted to inventing, manufacturing and distributing valuable medicines that enable people to live longer, healthier and more productive lives. The U.S. biopharmaceutical industry is the world leader in medical research – producing more than half the world’s new molecules in the last decade. Pioneering work by biopharmaceutical innovators in the United States contributes significantly to economic growth and supports good-paying jobs in all 50 states. As a key component of America’s high-tech economy, the research-based biopharmaceutical sector supports over 4.4 million jobs across the economy, including more than 900,000 direct jobs, and contributes more than $1.4 trillion in economic output on an annual basis when direct, indirect and induced effects are considered.

In 2020, 37 percent of U.S. biopharmaceutical industry employees were engaged in manufacturing at over 1,500 manufacturing plants across the country, nearly 35 percent were engaged in biopharmaceutical R&D, 25 percent were engaged in distribution and 3 percent were engaged in corporate administration. These important members of the U.S. innovative biopharmaceutical workforce partner with universities, clinical researchers, patient organizations, health care providers and others to bring new treatments and cures to patients who need them at home and abroad – introducing nearly 650 new therapies since 2000 and investing in many of the over 8,000 new drugs currently in development.

---

worldwide, with about three quarters having the potential to be first-in-class treatments.

Our sector also continues to be one of the most research-intensive, manufacturing-intensive and export-intensive in America, annually investing an estimated $122.2 billion in researching and developing new medicines. With the right policies and incentives in place at home and abroad, our member companies can continue to bring valuable new medicines to patients around the world. In 2022, U.S. biopharmaceutical goods exports exceeded $89 billion. The biopharmaceutical sector was the largest exporter of goods among the most R&D-intensive industries in 2020 – which in addition to biopharmaceuticals included navigational equipment, semiconductors and other electronic components, medical equipment and supplies and communications equipment.

The U.S. biopharmaceutical industry also is among the top five employers of U.S. manufacturing jobs, with more Americans directly employed in pharmaceutical manufacturing than in manufacturing in several other manufacturing industries, including each of the following: iron and steel products, aerospace products and parts, petroleum and coal products, and electric equipment and appliances.

Even more important than the biopharmaceutical sector’s role in the U.S. economy is its contribution to global patient health. Biopharmaceutical innovation extends lives, improves worker productivity and cuts health care costs. Between 1950 and 2016, life expectancy for women and men in the United States increased by more than a decade – adding trillions of dollars to the U.S. economy. New medicines are responsible for much of this increase. According to a National Bureau of Economic Research working

34 Analysis of National Science Foundation and Business Research and Development Survey (BRDIS) data by ndp analytics.
paper, new treatments accounted for three-quarters of life expectancy gains in the United States and other high-income countries between 2000 and 2009.  

For example, the AIDS death rate has dropped nearly 87 percent since the approval of antiretroviral treatments in 1995. Today, a 20-year-old diagnosed with HIV can expect to live another 50 years. New medicines have cut heart disease deaths by 38 percent, according to the Centers for Disease Control and Prevention. More than 80 percent of the increase in life expectancy of cancer patients since 1980 is attributable to new treatments. New hepatitis C therapies approved since 2013 cure over 90 percent of patients – a more than two-fold increase from previously available treatment options. As of October 2023, Airfinity estimates that nearly 16.5 billion doses of COVID-19 vaccines have been delivered around the world, and COVID-19 vaccination has saved tens of millions of lives around the world.

PhRMA member companies are building on these achievements and pioneering new treatments and cures for some of the world’s most devastating diseases. Researchers are developing more than 400 new medicines for infectious diseases, including viral, bacterial, fungal and parasitic infections such as the most common and difficult-to-treat form of hepatitis C, a form of drug-resistant malaria, a form of drug-resistant MRSA, and a novel treatment for smallpox.

---

40 Id.
genomics are propelling the discovery of new medicines to treat a range of chronic and infectious diseases. Made using living organisms, biologic medicines are revolutionizing the treatment of cancer and autoimmune disorders. Biologics are critical to the future of the industry and promise progress in the fight against conditions like Alzheimer’s, a debilitating disease affecting millions.46 The mRNA technology platforms, which are the backbone of the most effective COVID-19 vaccines, could potentially revolutionize vaccinology and help fight cancer, immune-mediated diseases and rare diseases.47

New medicines can lower the overall cost of treating these and other devastating diseases by reducing medical complications, hospitalizations and emergency room visits. For example, the use of cholesterol-lowering statin drugs has cut hospitalizations and saved the U.S. health care system at least $5 billion.48 Every $24 spent on new medicines for cardiovascular diseases in OECD countries saves $89 in hospitalization costs.49 Treating high blood pressure according to clinical guidelines would result in annual health system savings of about $15.6 billion.50 In addition to lowering overall health care costs, appropriate use of medicines can increase worker productivity by reducing rates of absenteeism and short-term disability.51 A 2012 study demonstrated that appropriate use of diabetes medicines saved 15 percent and 20 percent per month in medical spending after one year of initiating treatment52 and an estimated reduction of more than one million emergency department visits and hospitalizations annually, for an annual savings of up to $8.3 billion.53

PhRMA members are working to overcome significant systemic challenges that can prevent the poorest patients from accessing medicines. Together with governments, academia and others, they are leading more than 300 initiatives with more than 1,000

46 Id.
partners to help shape sustainable solutions that improve the health of all people.\textsuperscript{54} In
2017, more than 20 biopharmaceutical companies joined the World Bank and the Union
for International Cancer Control to launch Access Accelerated – a first-of-its-kind global
initiative to address cancer and other non-communicable diseases that cause more than
28 million deaths per year in low and lower-middle income countries.\textsuperscript{55}

Between 2000 and 2011, biopharmaceutical innovators contributed an estimated
$98.4 billion dollars toward achieving health-related Millennium Development Goals.\textsuperscript{56}
Despite a three percent drop in public funding for neglected disease (excluding Ebola)
research and development in 2014, biopharmaceutical industry funding increased by 28
percent during the same period.\textsuperscript{57}

\textbf{B. Policies that power prevention, treatments and cures}

Fair and transparent access to overseas markets and strong protection and
enforcement of patents, regulatory test data and other intellectual property provide
powerful incentives that drive and sustain substantial investments in valuable treatments
and cures. Where markets are open, innovation is valued and intellectual property is
protected and enforced, biopharmaceutical innovators have the predictability and
certainty that they need to collaborate with partners, compete successfully and accelerate
the launch of new medicines.

\textsuperscript{55} Access Accelerated, “22 Biopharma Companies Partner and Launch Access Accelerated,” Jan. 2017,
Development Goals,” Hudson Inst., May 2013, available at
hudson-institute (last visited Oct. 21, 2023).
\textsuperscript{57} Global Funding of Innovation for Neglected Diseases: G-Finder, available at
As highlighted in Figure 1 above, research, development and distribution of innovative medicines increasingly involves collaboration and the exchange of commercially sensitive information between multiple partners across borders and around the world. Strong intellectual property protection and enforcement enable innovators to license their patented inventions to others with the certainty that valuable information disclosed is secure. Thanks to the technology transfer framework established by the Bayh-Dole Act, voluntary licensing of intellectual property is also enabling collaboration among industry, university and public sector researchers in the development of new medicines and other products – adding close to $591 billion to the U.S. economy and supporting more than four million American jobs between 1996 and 2015. Such collaboration is delivering similar benefits in other countries. Research in the United Kingdom found that public expenditure on biomedical and health research leveraged even greater private sector investment, delivering a total rate of return to public biomedical and health research of up to 28 percent.

Patents and market-based pricing policies promote competition and greater treatment options. In exchange for the limited period of protection that patents provide,

innovators must fully disclose their inventions to the world. That disclosure accelerates innovation and empowers potential competitors to build on those inventions. Competition means more medicines in the same therapeutic class, more options for patients and even lower prices. For example, less than a year after market entry of the first in a new class of hepatitis C treatments, there were multiple suppliers that competed both on price and clinical benefits. Indeed, competition was so fierce that the largest U.S. pharmacy benefit manager claimed hepatitis C treatment is less expensive in America than in other western countries. European countries have seen similar gains from competition.

Today, biopharmaceutical innovators face competition faster – both from other innovators and from generic drug companies. In the 1970s, a new medicine might remain the only innovative treatment available in its therapeutic class for ten years or more. By the 2000s, that period had declined to about two years. Generic competitors now challenge patents earlier and more frequently – even as early as four years after the launch of an innovative medicine. Today, over 94 percent of innovative medicines experience at least one patent challenge prior to generic entry – compared to 25 percent in 1995. Increasing competition from biosimilars is driving down the cost of cutting-edge treatments.

Patents promote faster access to new medicines. A major 2014 study found firms launch innovative medicines sooner in countries where there is effective patent protection and enforcement. The study looked at data from the launch of more than 600 drugs in almost 80 countries between 1983 and 2002. It showed that strong patent protection accelerates new product launches in higher and lower income countries alike. Launching a medicine in a particular market also has important effects on the whole health care system. For instance, when a new medicine is introduced, biopharmaceutical companies invest in educating health care providers on the science and appropriate use

---

65 Id.
of that medicine.\textsuperscript{68} This investment later enables accelerated acceptance of generic versions once relevant patents expire.

Strong intellectual property protection and enforcement has long been a critical goal of America’s trade policy agenda. Strong intellectual property protection and enforcement at home and abroad, and the efficient market conditions necessary to enjoy those rights, provide essential incentives for investment in the biopharmaceutical sector and in all of the innovative industries that today account for more than 40 percent of U.S. gross domestic product.\textsuperscript{69} For each of these industries, developing and bringing new products and processes to market is a risky endeavor; it requires time and substantial resources. In most cases, new products will fail to deliver returns that meet or exceed investment. Some three-quarters of all venture capital-backed internet startups fail.\textsuperscript{70} And even those that succeed often fail to make a profit. Biopharmaceutical firms face similar challenges. Just two of every ten marketed medicines achieve returns that match or exceed average research and development costs.\textsuperscript{71} Of the approximately 1,200 biopharmaceutical companies in the United States, more than 90 percent do not earn a profit.\textsuperscript{72}

\begin{footnotesize}
\begin{enumerate}
\end{enumerate}
\end{footnotesize}
The lengthy approval process for new products makes the research-based biopharmaceutical sector particularly reliant on the temporary protection intellectual property rights provide.73 Unlike products made by other innovative industries, new medicines are not market-ready at the time they are developed. As highlighted in Figure 2 above, biopharmaceutical firms rigorously test and evaluate potential therapies through a series of clinical trials to demonstrate they are safe and effective for treatment of a particular disease or condition.74 In 2017, biopharmaceutical companies sponsored more than 4,500 clinical trials in the United States alone, with trials in all 50 states, the District of Columbia and Puerto Rico. These trials involved close to one million participants and accounted for nearly $43 billion in economic activity.75 Test data generated through those trials is then submitted to national regulatory agencies for marketing approval.

For these reasons and others, research and development is more capital intensive in the innovative biopharmaceutical sector than in other industries. Firms in this sector

---

invest twelve times more in research and development per employee than the average of all other manufacturing industries. In 2020 alone, American biopharmaceutical companies invested approximately $122 billion in research and development. Clinical trials can account for more than 60 percent of the total cost of bringing a new medicine to market, and there is no guarantee promising molecules and proteins that enter clinical trials will result in a new treatment or cure. The process of evaluating potential new therapies is so exacting that less than 12 percent of all potential new drugs entering clinical trials result in an approved medicine.

Advances in the treatment of diseases typically are not driven by large, dramatic developments, but more commonly build on a series of continuous improvements over time. The best clinical role and full value of a particular therapy typically emerges years after initial approval as further research is conducted and physicians and other health care providers gain real-world experience. These improvements and the further development of therapeutic classes of medicines often lead researchers to explore new treatments in related areas – restarting the research and development cycle. Indeed, nearly a quarter of existing therapeutic indications are treated by medicines initially developed to address a different concern. In fact, most life-saving COVID-19 therapeutics were developed from existing therapeutic indications and more than 60 percent of therapies on the World Health Organization (WHO) Essential Medicines List relate to improvements on older treatments. This step-by-step transformation in knowledge has led to increased survival, improved patient outcomes and enhanced quality of life for many patients.

II. Practices that Undermine Innovation and Access to New Treatments

To research, develop and deliver new treatments and cures for patients who need them around the world, biopharmaceutical innovators must be able to secure and effectively enforce patents and protect regulatory test data. They must be able to obtain timely marketing approval for new medicines and make those therapies available to patients according to reimbursement rules and procedures that are fair, transparent, reasonable and non-discriminatory, and that appropriately value and reward patented pharmaceuticals. These conditions are also necessary to facilitate U.S. exports and ensure that the competitive biopharmaceutical industry can continue to provide jobs and advance the economic interests of the United States.

For well over a century, governments have recognized the need for global minimum standards that enable inventors to effectively and efficiently protect and share their inventions in a territorial system of intellectual property rights. Signed in 1883, the Paris Convention for the Protection of Industrial Property allowed inventors, regardless of nationality, to claim priority for their inventions and to take advantage of the intellectual property laws in each member country. To facilitate the process of filing patent applications around the world, many members of the Paris Convention established the Patent Cooperation Treaty (PCT) in 1970. Today, more than 90 percent of all countries are members of the Paris Convention and the PCT.

The WTO TRIPS Agreement, which entered into force in 1994, was a major achievement in strengthening the worldwide protection and enforcement of intellectual property rights by creating an international minimum standard of protection for intellectual property rights. TRIPS was premised on the view that its obligations, if faithfully implemented by the diverse WTO Membership,83 would create the policy and legal framework necessary for innovation-based economic development of WTO Members by rewarding innovation with reliable rights-based systems and permitting the flow of its attendant commercial benefits. Because it concerns both the definition and enforcement of rights, TRIPS is one of the single most important steps toward effective protection of intellectual property globally. WTO Members, including the United States, have an important role to play in fully and effectively implementing, reiterating and enforcing TRIPS minimum standards.

Decisions and efforts to waive or otherwise weaken TRIPS obligations, including the TRIPS waiver on COVID-19 vaccines or the proposed TRIPS waiver expansion to COVID-19 diagnostics and therapeutics, by definition and design undermine and devalue the intellectual property protections that the TRIPS Agreement provides to Americans. Furthermore, such decisions and efforts embolden countries to take additional steps to weaken protection of intellectual property rights on American innovation.

Notwithstanding the Administration’s support for the TRIPS waiver on COVID-19 vaccines, the United States and other countries historically have promoted, implemented

---

83 164 members as of July 29, 2016.
and built on the global minimum standards of protection provided by the TRIPS Agreement through eligibility criteria for trade preference programs, WTO accessions and regional and bilateral trade agreements that establish strong intellectual property protections and require fair and equitable market access. However, certain U.S. trading partners maintain or are considering acts, policies or practices that are harming or would harm the ability of biopharmaceutical innovators to research, develop and deliver new treatments and cures for patients around the world. These acts, policies or practices deny or would deny adequate and effective intellectual property protection and/or fair and equitable market access for innovative medicines. In many cases, they appear to be inconsistent with global, regional and bilateral rules.

In 2020, India and South Africa sponsored a broad proposal at the WTO TRIPS Council calling to eliminate, for an indefinite term, certain WTO obligations to grant intellectual property on a wide range of technologies related to COVID-19. That proposal ultimately spurred the TRIPS waiver decision that the WTO Membership adopted on June 17, 2022. The waiver decision marks a significant escalation in anti-intellectual property global activism and has further polarized legitimate conversations on countries' engagement to combat the pandemic. As discussed previously, intellectual property rights were never a barrier to access COVID-19 vaccines and the TRIPS waiver will do nothing to address continuing challenges to distributing and administering the global surplus of those vaccines. Rather, the TRIPS waiver undermined the response to the pandemic, threatens to undermine the ability to respond to future health crises and inevitably will affect intellectual property discussions in countries around the world.

The TRIPS waiver is a prominent example of how some countries have used the COVID-19 pandemic opportunistically to advance longstanding industrial policies and to further erode intellectual property policies. These governments ignore the value of intellectual property, including enabling increased participation in the global economy and the availability of new technologies – not least the creation, production, and delivery of innovative COVID-19 vaccines and therapeutics in record time. Since TRIPS took effect in 1994, economic growth has accelerated, billions have been lifted from poverty and global health has improved significantly.84 Indeed, the innovations supported, incentivized and licensed as a consequence of intellectual property protections, including those championed by TRIPS, have saved millions of lives around the globe.85 Moreover, evidence suggests that strong intellectual property protections, including those obligations established via TRIPS, are linked to increased technology transfer to developing countries and promote indigenous innovation by local companies.86

Multilateral organizations increasingly are seeking to undermine and even eliminate intellectual property protections that drive and sustain biopharmaceutical innovation in the United States and around the world. By reinterpreting international agreements and through meetings, reports, guidelines and training programs, the WTO, the WHO, the United Nations Development Program (UNDP), the United Nations Conference on Trade and Development (UNCTAD), Unitaid and other organizations are promoting acts, policies and practices globally and in specific countries that prevent biopharmaceutical innovators from securing and maintaining patents, protecting regulatory test data and enjoying fair and equitable market access.  

In 2022, the Director General of the WHO released ten proposals that reflected his design for a new global architecture for Health Emergency Preparedness, Response and Resilience (HEPR). The proposals are grouped by the three main pillars of the global HEPR architecture: governance, systems and financing, and are based on three key principles of equity, inclusiveness and coherence. The WHO Secretariat has embraced these pillars in its design of the Pandemic Prevention, Preparedness and Response (PPR) Instrument. The early drafts of the Pandemic PPR Instrument include provisions that endanger intellectual property rights, force technology transfer, and advocate pricing controls. In that spirit, Member States are encouraged to mandate WHO to maintain its focus on its core public health mission as a global technical authority, setting norms and standards. In addition, while the HEPR recognized the critical role that public-private partnerships had in bringing life-saving treatments and vaccines to the pandemic in record time, the WHO continues to exclude the private sector from most of its strategy and planning endeavors. The private sector should be seen as a critical partner in preparedness, response and recovery, and should have a seat at the table.

The following sections highlight the most serious challenges facing PhRMA members around the world. The acts, policies and practices of specific governments are described further below. PhRMA members urge USTR and other federal agencies to highlight these challenges, acts, policies and practices in the 2024 NTE Report and to use all available tools to address and resolve them.

A. Practices that deny fair and equitable market access

PhRMA members increasingly encounter acts, policies and practices abroad that deny fair and equitable market access. Through arbitrary and often discriminatory government price controls, unnecessary regulatory delays and high tariffs and taxes, markets across Europe, Asia, the Americas and beyond are limiting market competition, increasing costs and undermining the ability of biopharmaceutical innovators in the United States to bring new medicines to patients who need them.

88 Available at https://cdn.who.int/media/docs/default-source/emergency-preparedness/who_hepr_june30draftforconsult.pdf?sfvrsn=e6117d2c_4&download=true (last visited Oct. 21, 2023).
In recent years, America’s biopharmaceutical sector has witnessed a surge in the number and severity of arbitrary and discriminatory government price controls abroad that threaten U.S. exports and jobs. Such measures cause serious damage in the economies that maintain them by rationing patient access to health care. They also can have significant ripple effects across other markets. For example, government price controls implemented in one market can spill over to many other markets through international reference pricing. These policies can restrict competition and artificially depress prices below market value, ultimately delaying and denying patient access to new medicines.89

A 2004 Commerce Department study found that international reference pricing and other such measures that “rely heavily on government fiat to set prices rather than competition in the marketplace” put short-term government objectives ahead of long-term strategies that would ensure continued R&D into medicines that patients need most.90 The report showed that moving to market-based systems would add billions to research and development for new medicines and lower overall health care costs around the world by promoting greater efficiencies in off-patent markets. A 2020 report from the Council of Economic Advisers found that foreign government price controls have worsened over the past 15 years, causing innovative products to be sold “below fair market value,” leading to a “slower pace of innovation” and “fewer potential new life-saving therapies for patients in all countries.”91 Urgent action is needed to address and resolve the following government price control regulations, policies and practices that are limiting market access for medicines researched and developed in the United States:

- **Government price controls.** In many markets, governments are the primary payer of medicines and in effect dictate prices. This dominant position often results in U.S. trading partners failing to appropriately recognize the value of innovation in their pricing and reimbursement policies, instead engaging in actions that distort markets and artificially depress prices below what a competitive market would provide. Foreign governments are increasingly employing a range of regulatory measures, including international reference pricing, therapeutic reference pricing, mandatory price cuts, clawback payments and flawed health technology assessments. These measures are often layered to exert maximum pressure. Over the past several years, Japan has implemented over 50 changes to pricing policies that substantially undermine efforts to carry a fair share of the costs of global research and development. In particular, the eligibility criteria for the Price Maintenance Premium (PMP) program as well as other price-cutting measures

such as annual price cuts to patented medicines and health technology assessments designed to erode premiums for innovation will mean that some of America’s most innovative medicines will be significantly undervalued. **Korea** employs several price control measures – including health technology assessments that require unreasonable thresholds for “cost-effectiveness,” international reference pricing of inappropriate off-patent and generic comparators, and *ad hoc* measures – to systematically cut prices. In **Canada**, the Patented Medicine Prices Review Board regulates the maximum allowable price that a manufacturer can charge for a patented medicine to public or private payers. The Board continues to consider draconian changes intended to set prices at levels paid by less wealthy countries. Examples of other highly developed markets that undervalue innovative medicines include **Australia**, countries in the **European Union** and the **United Kingdom**.

- **Discriminatory market access policies.** In some markets, governments have policies that further benefit domestic drug companies and wholesalers at the expense of innovators in the United States. For example, in 2018, **Japan** revised its PMP program based on company criteria that appear to be inherently biased towards domestic and larger companies (e.g., number of local clinical trials and whether the product was launched first in Japan). These new company criteria call into question Japan’s commitment to fair and non-discriminatory policies, including that of national treatment. In **Korea**, the Ministry of Health and Welfare designates certain companies as Innovative Pharmaceutical Companies (IPCs), which receive tax credits, R&D support and more favorable drug pricing. As of September 2022, only three of 47 designated IPCs are non-Korean biopharmaceutical companies. PhRMA is concerned that this policy violates national treatment obligations and the spirit of KORUS Article 5.1. In **Thailand**, the Thai Innovation List and the Made in Thailand initiatives give only Thai majority-owned companies special government procurement privileges, including an earmark for at least 30 percent of orders by Thai Government agencies. Paradoxically, it appears that to qualify as a pharmaceutical innovator and be eligible for inclusion on the list, the Thai company needs only to demonstrate that their generic copy is bioequivalent to the originator product.

Other acts, policies and practices delay or limit market access for America’s biopharmaceutical innovators and the benefits patients overseas could realize from faster access to medicines and greater competition between treatments in the same therapeutic class. These barriers include:

- **Import barriers.** High tariffs and taxes can limit U.S. biopharmaceutical exports and prevent access to new treatments in overseas markets.92 Under the WTO Pharmaceutical Agreement, the United States and the 33 other countries do not

---

impose any import duties on a wide range of medicines and other health products. However, biopharmaceutical innovators in the United States do not benefit from the same access to China, India and other emerging economies that, despite being major producers and exporters of drugs and active pharmaceutical ingredients, are not parties to the WTO Pharmaceutical Agreement. Between 2006 and 2013, the value of worldwide biopharmaceutical trade in countries that are not parties to that Agreement increased at a compound annual growth rate of more than 20 percent. This means that a larger proportion of medicines distributed around the world are potentially subject to tariffs. For example, India’s basic import duties on biopharmaceutical products and active ingredients average about ten percent. Additional duties and assessments can raise India’s effective import duty to as high as 20 percent or more. Combined federal and state taxes account for 31 percent of the cost of medicines in Brazil, one of the highest tax burdens on medicines in the world compared to the global average of 6 percent. Examples of other countries that maintain high tariffs and taxes on imported medicines include Argentina, Russia and Thailand. To level the global playing field for the U.S. biopharmaceutical industry and its workers, USTR should engage meaningfully at the WTO to increase both the membership and the product scope of the WTO Pharmaceutical Agreement.

- **Regulatory approval delays.** China remains an outlier in the drug approval process compared to other regulatory authorities, with new medicines typically taking longer to reach patients in China than in other large economies. Examples of other countries with complex and lengthy regulatory approval processes include Mexico, Russia and Turkey. Accelerating regulatory approval in these countries and others will improve the efficiency of global drug development, facilitate U.S. exports and reduce the time it takes for new medicines to reach patients.

- **Government pricing, reimbursement and procurement delays.** Restrictive government pricing, reimbursement and procurement policies delay market access for biopharmaceutical innovators in the United States and prevent timely patient access to new treatments and cures that have received regulatory approval. These processes vary by market with the result that government

---

95 Id.

97 Brazilian Institute of Tax Planning, 2018.
reimbursement decisions can be almost immediate in some markets to several years in others. For example, in Mexico, delays can stretch as long as 1,500 days or more. In Canada, only 21 percent of new medicines launched globally since 2012 are reimbursed by public plans, with public plan patients waiting an average of 52 months from global first launch to reimbursement for the fewer medicines that become available. In the United Kingdom, medicines are often not funded for their full market authorization, restricting patients from treatments proven to be effective. While China has undertaken efforts to accelerate updates to its national reimbursement list, patients would be better served by a model that allows all new drugs to be reviewed for reimbursement on a more regular, or rolling, basis with faster implementation at the hospital level.

- **Lack of transparency and due process.** Lack of transparency, due process and delayed reimbursement decisions are widespread across the world. Canada, Japan and Korea continue to make significant pricing policy reforms without adequate consultation with the industry. In Mexico, excessive regulatory approval delays are compounded by new government procurement processes that lack transparency, are applied inconsistently and frequently change without warning or consultation. In Taiwan, the pricing and reimbursement process for innovative medicines lacks transparency, due process and meaningful opportunities for stakeholder input, as exemplified by the National Health Insurance Administration’s mandatory renegotiation of Managed Entry Agreements and recent application of Health Technology Reassessments. In Turkey, reimbursement decision criteria are not clearly defined, the process is non-transparent and unpredictable delays in decision-making significantly postpone patient access to innovative medicines. The United States has previously recognized the serious nature of these types of concerns and attempted to redress several of them through a variety of trade policy initiatives. For example, the United States-Mexico-Canada Agreement (USMCA) requires Canada and Mexico to adhere to detailed transparency and procedural fairness obligations, and the United States-Korea Free Trade Agreement (KORUS) requires Korea to comply with similar specific commitments. PhRMA and its member companies request continued U.S. Government attention to these issues and encourage the Administration to strengthen its enforcement of our trading partners’ commitments in these areas.

More broadly, PhRMA members recognize the efforts historically undertaken by the U.S. Government to address these barriers, including eliminating tariffs and promoting fair, reasonable and non-discriminatory pricing, reimbursement and procurement policies in trade agreements and addressing regulatory approval delays and other market access

---

challenges in bilateral forums. As more markets enact price controls, the burden for financing medical advances will be borne increasingly by U.S. patients and biopharmaceutical innovators, while patients abroad will suffer decreased access to improved therapies over the long term. It remains critical that the U.S. Government engage on these issues with its trading partners, effectively enforce U.S. trade agreements and require immediate and meaningful steps by foreign governments to resolve existing barriers and to ensure that patients have faster access to new medicines.

**B. Practices that undermine biopharmaceutical innovation**

The six intellectual property challenges described below and highlighted in Figure 3 have serious and immediate impacts on the ability of PhRMA members to invest in discovering and transforming promising molecules and proteins into useful new medicines for patients around the world. These challenges hinder or prevent biopharmaceutical innovators from securing patents (restrictive patentability criteria and patent backlogs), maintaining and effectively enforcing patents (market-size damages, weak patent enforcement and compulsory licensing), and protecting regulatory test data (regulatory data protection failures).

**Figure 3: Biopharmaceutical intellectual property challenges**
Restrictive Patentability Criteria

To bring valuable new medicines to patients, biopharmaceutical innovators must be able to secure patents on all inventions that are new, involve an inventive step and are capable of industrial application. National laws, regulations or judicial decisions that prohibit patents on certain types of biopharmaceutical inventions or impose additional or heightened patentability criteria restrict patient access to valuable new medicines and undermine investment in future treatments and cures. These restrictions prevent innovators from building on prior knowledge to develop valuable new and improved treatments that can improve health outcomes and reduce costs by making it easier for patients to take medicines and by improving patient adherence to prescribed therapies. Some of the most serious examples of restrictive patentability criteria challenges facing PhRMA members in countries around the world include:

- Patentability restrictions and additional patentability criteria. A number of countries maintain laws and regulations that, per se, prevent the patenting of a wide range of specific improvements to existing medicines – improvements that are

---

100 See generally, TRIPS Article 27.1.

101 New improvements to existing treatments, such as new dosage forms and combinations, are of tremendous value to patients. They can make it easier for patients to take medicines and increase patient adherence. Specifically, they make it more likely patients will take their medicines consistently and as prescribed. Such improvements might allow patients to take an oral medication instead of an injection or reduce the number of doses required. Adherence is inversely proportional to the number of times a patient must take their medicine each day. The average adherence rate for treatments taken once daily is nearly 80 percent, compared to about 50 percent for medicines that must be taken four times a day. Patient adherence to prescribed courses of treatment leads to better health outcomes and is particularly important for the management of chronic, non-communicable diseases like diabetes, heart disease and cancer. According to the WHO, “[a]dherence to therapies is a primary determinant of treatment success.”

102 Encouraging patients to take their medicines consistently and as prescribed can lower overall health care costs. The cost of non-adherence has been estimated at $100 billion to $300 billion annually, including the costs of avoidable hospitalizations, nursing home admissions and premature deaths. Making patents available for improvements and new indications can also drive price competition for medicines by encouraging the development of alternative treatments – leading to multiple drugs in a single therapeutic class and increasing the range of options for patients and health care providers.

103 Examples of improvements include enantiomers and combination treatments. See Stevens P, Ellis J, “Enantiomer Patents,” Geneva Network, June 2017; and Stevens P, Ellis J, “The
valuable to patients and payers and that require significant investment and research to develop. For example, **Argentina** issued regulations in 2012 that prevent biopharmaceutical innovators from securing patents on certain types of inventions, including new dosage forms and combinations. In the **Philippines**, national law limits patentability of new forms and new uses of existing medicines. **Indonesia** adopted a new patent law in 2016 that similarly prohibits patents for new forms and new uses of existing medicines. **India**’s Patent Law harms its own domestic drug companies by prohibiting patents on new forms and new uses of known substances, unless applicants can demonstrate they meet an additional “enhanced therapeutic efficacy” test.

In addition, multilateral organizations such as UNDP and Unitaid advocate actively for patentability restrictions and additional patentability requirements that are inconsistent with international practice. For example, although UNDP does not appear to have specialized expertise on intellectual property matters, it issued patent examination guidelines in 2016 that, if followed, would prevent innovators from securing patents on many kinds of biopharmaceutical inventions. Similarly, Unitaid partnered with various non-governmental organizations in 2018 to launch a campaign to erode intellectual property policies and laws globally.

- **Restrictions on post-filing submissions.** Unlike patent offices in the United States, Europe, Japan, Korea and other major markets, **China**’s National Intellectual Property Administration (CNIPA) does not consistently accept data generated after a patent is filed during patent prosecution to describe inventions or satisfy inventive step requirements. Consistent with its commitments in Article 1.10 of the Economic and Trade Agreement between the United States and China (U.S.-China Economic and Trade Agreement), China has issued a judicial interpretation providing that the Court will review post-filing experimental data and CNIPA has amended its Patent Examination Guidelines. PhRMA and its members welcome these positive steps and will be closely monitoring implementation of the revised Guidelines to ensure that they permit pharmaceutical patent applicants to rely on supplemental data to satisfy relevant requirements for patentability.

Restrictive patentability criteria in many of these countries and others are inconsistent with WTO rules and U.S. trade agreements, which require parties to make patents available for inventions that are new, involve an inventive step and are capable

---

of industrial application. These laws also appear to apply solely to pharmaceutical products, either expressly by law or in a de facto manner as applied. This is not consistent with the obligations of WTO Members and U.S. trade agreement partners to make patents available without discrimination as to the field of technology.

PhRMA members appreciate steps that USTR and other federal agencies have taken to address restrictive patentability criteria and look forward to continuing to work closely with these agencies to secure concrete progress and real results. Effective enforcement of U.S. trade agreements is needed to resolve these challenges in particular countries and to prevent others from adopting similar practices.

**Patent Backlogs**

Long patent examination and approval backlogs harm domestic and overseas inventors in every economic sector. Backlogs undermine incentives to innovate, prevent timely patient access to valuable new treatments and cures, and impose huge societal costs. Because the term of a patent begins on the date an application is filed, unreasonable delays can directly reduce the value of granted patents and undermine investment in future research. For biopharmaceutical companies, patent backlogs can postpone the introduction of new medicines. They create legal uncertainty for research-based and generic companies alike and can increase the time and cost associated with bringing a new treatment to market.

- Patent backlogs are a challenge around the world, but a few countries stand out for persistently long delays. In Brazil, a 2022 analysis found that the average patent examination timelines for biopharmaceutical patents exceeds 10 years. In Thailand, where the government approved a patent application filed by one PhRMA member six weeks before the patent expired, it can take ten years or more to secure a patent on a new medicine. The situation is only somewhat better in markets like India, where it takes an average of six years to secure a patent.

---

111 Id.
and yet in 2015, India granted one patent based on an application filed 19 years earlier.\textsuperscript{112}

Long patent examination delays cause significant damage. A London Economics study estimated the value of lost innovation due to increased patent pendency at £7.6 billion per year.\textsuperscript{113} Patent backlogs are a particular challenge for small start-up firms that are playing an increasingly important role in biopharmaceutical innovation. According to a U.S. Patent and Trademark Office (PTO) Economic Working Paper, for every year an ultimately-approved patent application is delayed, a start-up firm’s employment growth decreases by 21 percent and its sales growth decreases by 28 percent on average over the following five years.\textsuperscript{114} Each year a patent application is delayed, the average number of subsequent patents granted decreases by 14 percent and the probability that a startup will go public is cut in half.\textsuperscript{115}

PhRMA members support patent term adjustment provisions in trade agreements and national laws to address unreasonable patent examination delays. They support initiatives to increase the efficiency of patent prosecution and reduce patent backlogs, including the PCT and work sharing arrangements through the IP5 and Patent Prosecution Highway (PPH) programs. In Brazil, the 2021 Supreme Court decision finding that the sole paragraph of Article 40 of the Patent Law, which ensured a minimum patent term of 10 years from the date of patent grant in Brazil, is unconstitutional leaves patent applicants no recourse for unreasonable delays during examination of patent applications. Further, damaging legislation in the European Union has weakened patent term restoration (PTR) mechanisms by reducing the patent protections restored through Supplementary Protection Certificates (SPCs). In addition, the European Commission is proposing to establish a new mechanism for third parties to oppose SPCs. Also, Singapore should adjust its PTR mechanism to compensate the patent holder for the time invested in conducting clinical trials either in Singapore or in any other market when such data is a condition of obtaining marketing approval in Singapore. In addition, industry was disappointed to hear the sudden announcement on January 6, 2021, that the Gulf Cooperation Council (GCC) Patent Office was no longer accepting patent applications, thereby requiring innovators to file their patent applications in each of the GCC Member States rather than through the one office. This deprives innovators of the benefit of obtaining patent protection in all GCC Member States by filing one single regional application, which significantly reduced the financial and administrative burden on right

\textsuperscript{115} Id.
holders. While we are glad to hear that the GCC Patent Office recently resumed handling patent applications, to date only Bahrain, Kuwait and Qatar have indicated that they will use this service, creating further uncertainty regarding how pending patent applications will be examined. Further work is needed to consolidate gains in patent protections and to extend effective models to other countries.

**Compulsory Licensing**

Biopharmaceutical innovators support strong national health systems and timely access to safe, effective and high-quality medicines for patients who need them. Patents drive and enable research and development that delivers new treatments and cures. These limited and temporary intellectual property rights are not a barrier to access to medicines\(^{116}\) – particularly when governments and the private sector partner to improve health outcomes.

Compulsory licenses (CLs) have been issued in several countries, including India, Indonesia, Colombia, Russia and Malaysia, that allow local companies to make, use, sell or import particular patented medicines without the consent of the patent holder. Other governments, including Argentina, Australia, Brazil, Chile, El Salvador, European Union, Peru, the Philippines, Saudi Arabia, Turkey, the United Arab Emirates (UAE) and Vietnam, have adopted or considered resolutions, laws or regulations that promote or provide broad discretion to issue CLs, provide inadequate opportunity for patent holders to respond to CL petitions and appeal CL grants, and discriminate against pharmaceutical patents. Some countries, including Hungary and Indonesia, have adopted emergency regulations or presidential decrees that facilitate use of CLs for COVID-19 products without due process or basic engagement with the patent holder. In Brazil, members of the National Congress continue to consider efforts to expand inappropriately compulsory licensing provisions in Brazil’s Industrial Property Law. PhRMA believes that governments should grant CLs in accordance with international rules and only in exceptional circumstances and as a last resort. Decisions should be made through fair and transparent processes that involve participation by all stakeholders and consider all relevant facts and options.

Experience and recent research demonstrate that compulsory licensing is not an effective way to improve access or achieve other public health objectives. It does not

necessarily lower prices\textsuperscript{117} or speed access\textsuperscript{118} in the short-term or provide sustainable or comprehensive solutions to longer-term challenges. It does not address systemic barriers to access\textsuperscript{119} – from weak health care delivery systems to low national health care funding and high taxes and tariffs on medicines. Compulsory licensing is particularly ineffective relative to the many alternatives available. Biopharmaceutical innovators support different tools and programs that make medicines available to patients who could not otherwise afford them, including drug donation and differential pricing programs, voluntary licensing and non-assert declarations.\textsuperscript{120} In sub-Saharan Africa, for example, the majority of antiretrovirals are manufactured under voluntary licenses to local generic drug companies.\textsuperscript{121} Indeed, the successful use of various mechanisms, such as voluntary licenses, explains why the compulsory licensing provisions in TRIPS have rarely been utilized. As several WTO Members have argued, the limited use is not surprising given that the vast majority of essential medicines are not patented and that developing countries acquire medicines through voluntary licenses for those medicines that are subject to intellectual property protections.\textsuperscript{122}

Unfortunately, despite the evidence indicating that CLs are a deeply flawed means of facilitating access to medicines, some countries appear to be using CLs to promote the local production of medicines at the expense of manufacturers and jobs in the United States and elsewhere.\textsuperscript{123} For example, Indonesia issued CLs for certain antiviral COVID-19 therapeutics, disregarding the voluntary licensing agreement already in place with the right holder for one of the COVID-19 therapeutics. Similarly, Russia, which has made no

secret of its intent to compel local manufacturing, has granted CLs for a COVID-19 therapeutic. Malaysia issued a CL in 2017 in a move that appears designed to facilitate the local development and marketing of a competing combination product. Since then, the Malaysian government appears to be inappropriately leveraging the CL to encourage medical tourism and travel to Malaysia. In 2013, India’s Intellectual Property Appellate Board affirmed a CL for a patented oncology medicine, based in part on a finding that the patented medicine was not being manufactured in India.

In its 2020 Special 301 Report, USTR rightly highlighted concerning actions by “trading partners to unfairly issue, threaten to issue, or encourage others to issue compulsory licenses” and committed to “engage, as appropriate, with trading partners.” PhRMA members welcomed these statements and urge USTR and other federal agencies to engage to address serious and growing compulsory licensing threats across Latin America, Southeast Asia and elsewhere.

### Weak Patent Enforcement

To continue to invest in the research and development of new medicines, biopharmaceutical innovators must be able to effectively enforce patents. Mechanisms such as patent linkage that provide for the early resolution of patent disputes before potentially infringing follow-on products enter a market are essential for effective enforcement. The premature launch of a product that is later found to infringe a patent may disrupt patient treatment and require governments to adjust and re-adjust national formularies and reimbursement policies. For biopharmaceutical innovators, it may cause commercial damage that is impossible to repair later.

At a minimum, effective early resolution mechanisms (1) require governments to notify the holder of a patent on a biopharmaceutical product if another party applies for marketing approval for a generic or biosimilar versions of that product; (2) enable the holder of a patent on a biopharmaceutical product to seek provisional enforcement measures, such as a stay, preliminary injunction or interlocutory injunction, to prevent the marketing of a potentially infringing generic or biosimilar version of that product; and (3) provide for the timely resolution of patent disputes before marketing approval is granted for a generic or biosimilar.

PhRMA members welcomed the inclusion of effective patent enforcement commitments in the U.S.-China Economic and Trade Agreement. Although China implemented a number of measures in 2021 to establish an early patent dispute

---

resolution framework, we have concerns about the effectiveness of the resulting system. PhRMA and its member companies stand ready to work with the U.S. and Chinese governments on the implementation of an effective patent enforcement system in China, consistent with its commitments in Article 1.11 of the U.S.-China Economic and Trade Agreement and with a view to establishing an effective and commercially meaningful enforcement system for biopharmaceutical patents in China.

Biopharmaceutical innovators strongly supported passage of patent linkage legislation in Taiwan in late 2017. We welcomed regulations issued on January 30, 2019, to implement patent linkage for both biologic and chemically synthesized medicines. In July 2019, Taiwan published the final patent linkage regulation and shortly thereafter the Executive Yuan approved implementation of the patent linkage system effective August 20, 2019. Disappointingly, however, the Taiwan Food and Drug Administration unilaterally determined that Taiwan’s patent linkage system should not include patents that protect new doses, new dosage forms or new unit strengths. If allowed to continue, this action will seriously undermine the value of Taiwan’s patent linkage system. We stand ready to work with the Taiwan Government to support appropriate implementation of the regulation and to ensure that patents on all innovative medicines are effectively enforced.

U.S. trade agreements generally require parties to notify patent holders, to act expeditiously on requests for provisional enforcement measures and to prevent the marketing of generic or biosimilar products during the patent term without the consent of the patent holder. However, some U.S. trade agreement partners do not comply with these obligations. For example, despite its USMCA commitments, Mexico has not implemented an effective patent enforcement system, including providing timely and effective preliminary injunctions. Until recently, Australia did not require any notice of a third party’s intention to obtain marketing approval, so as to enable final resolution of patent claims before marketing approval, but further measures are required to notify patent holders more reliably.

Saudi Arabia has knowingly facilitated the infringement of the patent on a medicine formulated and exported from the United States by giving a local company approval to produce a competing product during the patent term. Similarly, in 2017 the UAE approved the sale of patent infringing generics despite the government’s pharmaceutical patent commitments in Ministerial Decree No. 404 and reciprocal patent recognition obligations under the Gulf Cooperation Council. Promisingly, Decree No. 321 (2020) suggests that the UAE may be poised to remedy this deficiency. In Bangladesh, local companies are taking advantage of the country’s least developed country (LDC) status to undermine intellectual property protections in other countries. Under the terms of a grace period adopted in 2001 (and extended in 2015), LDCs are not obligated to comply with WTO intellectual property rules. Local companies in Bangladesh are reverse engineering and making copies of biopharmaceutical products that are under patent in other parts of the world. These unlicensed biopharmaceutical products are entering markets abroad, e.g., India, where patent protection exists. The quality and

---

safety of these products have not been reviewed and could pose significant risks. Furthermore, local companies are adopting product names for biopharmaceutical products that are nearly identical to well-known product names of U.S. biopharmaceutical companies creating confusion in the market as to their source and/or association. These actions are not consistent with the spirit, if not the letter, of the LDC grace period.128

Effective early resolution mechanisms are also needed in India, Russia and other countries, where innovators are not notified of marketing approval applications filed for potentially infringing products and generally are unable to secure provisional enforcement measures. In the Philippines, early resolution mechanisms were available before a 2005 Department of Health Administrative Order (A.O. No. 2005-0001) took effect that required pharmaceutical patent holders to monitor follow-on products seeking FDA registration and to pursue costly and time-consuming legal remedies to avoid potential patent infringement.

PhRMA urges USTR and other federal agencies to enforce intellectual property commitments in existing U.S. trade agreements and to continue to promote effective patent enforcement abroad, including through bilateral dialogues such as the U.S.-India Trade Policy Forum.

Excessive and Punitive Damages

Biopharmaceutical innovators must be able to rely on and enforce patents issued by competent government authorities. Laws or policies that allow governments or other non-parties to a patent dispute to collect excessive and punitive damage awards after the fact from innovators that pursue unsuccessful patent claims unfairly penalize and discourage the use of provisional enforcement measures as part of well-functioning early resolution mechanisms. These policies undermine legal certainty, predictability and the incentive provided by patents to invest in new treatments and cures.

The ability to enforce patents in Canada continues to weaken. Canada’s current policies discourage and penalize innovators from seeking patent enforcement actions by enabling generic litigants to recover excessive and punitive damage awards simply because innovators unsuccessfully sought to protect patents granted by the Canadian Government. Pending court decisions could make that situation far worse – increasing the potential that innovators forfeit patents prematurely in Canada rather than defend them. Section 8 of the Patented Medicines (Notice of Compliance) Regulations (PM (NOC) Regulations) is intended to compensate generic drug companies that bring successful patent disputes against innovators for actual losses suffered during the stay period. But Canada’s courts are granting generic litigants damages in excess of 100 percent of the total generic market.

Canada’s implementing regulations of the Comprehensive Economic and Trade Agreement (CETA) further expose innovators to excessive liability under Section 8. These

128 Id.
regulations enable competitors to claim indefinite future loses and to seek compensation for production "ramp-up" costs that they may have incurred before the stay was granted and after it was lifted. In addition, other proceedings have been allowed to proceed under various common law theories (Statute of Monopolies, Trademarks Act, unjust enrichment and others). These cases could result in damages or liability for PhRMA members which exceed the compensatory threshold.

Australia’s Therapeutic Goods Act, passed as part of legislation implementing the U.S.-Australia Free Trade Agreement, provided for “market-size damages” in certain instances. Since 2012, the Australian Government has stated its intent to seek – and has sought – market-size damages from biopharmaceutical innovators that have pursued unsuccessful patent claims. Those damages are designed to compensate Australia’s pharmaceutical reimbursement scheme (PBS) for any higher price paid for a patented medicine during the period of a provisional enforcement measure. The PBS imposes automatic price cuts on medicines as soon as competing versions enter the market, but the policy entails no corresponding mechanism to compensate innovators for losses if an infringing product is launched prematurely.

By pursuing market-size damages, Australia is unfairly tipping the scales in commercial patent disputes – encouraging competitors to launch at risk and discouraging innovators from enforcing their patents. This action creates an inappropriate conflict of interest by permitting the same government that examined and granted a patent to seek damages if that patent is later ruled invalid or not infringed. It exposes innovators to significant additional compensation claims that are difficult to quantify and were not agreed to at the time provisional enforcement measures were granted. The size of these additional claims equates legitimate patent enforcement with patent abuse. Allowing governments or other non-parties to a patent dispute to collect market-size damages undermine legal certainty, predictability and the incentives patents provide for investment in new treatments and cures. Australia’s practice appears to be inconsistent with the U.S.-Australia Free Trade Agreement and WTO intellectual property rules, including with respect to provisional measures.

In a 2004 letter to Australia’s trade minister, USTR raised concerns about the significant and negative impact that the Therapeutic Goods Act amendments permitting market-size damages could have on patent rights and the consistency of those amendments with Australia’s international obligations. The letter stated that the “United States reserves its right to challenge the consistency of these amendments with such obligations.” PhRMA members urge USTR and other federal agencies to prioritize actions to address Australia’s pursuit of market-size damages.

---

Regulatory Data Protection Failures

Regulatory data protection (RDP) complements patents on innovative medicines. By providing temporary protection for the comprehensive package of information biopharmaceutical innovators must submit to regulatory authorities to demonstrate the safety and efficacy of a medicine for marketing approval, RDP provides critical incentives for investment in new treatments and cures.

RDP is a carefully balanced mechanism that improves access to medicines of all kinds. Prior to 1984, generic drug companies in the United States were required to generate their own test data for marketing approval. The Hatch-Waxman Act introduced abbreviated pathways that enabled generic drug companies to rely on test data developed by innovators. In exchange, innovators received a period of protection for test data gained through substantial investments in clinical trials over many years. As a result of this and other provisions of Hatch-Waxman, the percentage of prescription drugs filled by generics soared from 19 percent in 1984 to approximately 90 percent of all prescriptions filled in the United States today. Indeed, a new study shows just how important RDP is for improving patient access to medicines worldwide. Comparing 53 markets with and without RDP, the report finds that those with RDP have, on average, access to three times more innovative medicines. Furthermore, the report concludes that for every new innovative medicine introduced, approximately 2.5 generic or biosimilar medicines would follow (the number is higher in countries with strong generic industries, like Brazil, where the report finds that almost 3.2 generic or biosimilar products would result from each innovative product). Also, the report highlights that RDP is associated with a 70 percent increase in clinical trial activity and that the rate of return associated with clinical trials, either through income or job creation, is estimated to be between 39 and 64 percent.

RDP is particularly critical for biologic medicines, which may not be adequately protected by patents alone. Made using living organisms, biologics are so complex that it is possible for others to produce a version – or “biosimilar” – of a medicine that may not be covered within the scope of the innovator’s patent. For this reason and others, U.S. law provides twelve years of RDP for biologics. This was not an arbitrary number, but rather the result of careful consideration and considerable research on the incentives necessary to ensure biopharmaceutical innovators and the associated global scientific ecosystem are able to sustainably pursue groundbreaking biomedical research.

---

132 PhRMA analysis based on IQVIA National Sales Perspective and Quintiles, IMS Institute MIDAS™ audited data, 2017.
Unfortunately, many U.S. trading partners do not provide RDP. Examples, some of which are described further in the market profiles below, include Algeria, Argentina, Brazil, China, Egypt and India. Others, like Saudi Arabia, provide RDP but have allowed local companies to rely on data submitted by American innovators during the period of protection. This is contrary to WTO rules, which require parties to protect regulatory test data submitted as a condition of obtaining marketing approval against both disclosure and unfair commercial use. U.S. trade agreements generally require parties to provide RDP for a specified period of time, but some partner countries have not fully honored their commitments. For example, Mexico and Peru provide RDP for small-molecule treatments, but do not provide appropriate protection for biologics. Singapore does not provide RDP for new formulations, combinations, indications and dosage regimes. Alarming, proposals in the European Union would reduce the RDP term across the region and provide illusory opportunities to restore these lost years if certain conditionalities outside of the control of the innovator are met. Other countries have adopted mechanisms inconsistent with international rules that enable governments to circumvent RDP. In 2022, the UAE took steps to address discrepancies in its RDP regime. Specifically, the UAE clarified the relationship between Decree 321 and the new Industrial Property Rights Law (Law No. (11) of 2021), and confirmed the eight-year RDP term. We urge the UAE Government to codify this clarification and ensure that the Decree (and in particular the proposed exception in Article 5) is consistent with the UAE’s international commitments and that it is implemented in a manner that provides effective and meaningful RDP for all innovative pharmaceuticals (including biologics). Meanwhile, Canada passed legislation in 2014 that gives the Health Minister broad discretion to share undisclosed test data without safeguards to protect against unfair commercial use. Other countries provide RDP in a manner that discriminates against foreign innovators.

PhRMA urges USTR and other federal agencies to enforce intellectual property commitments in existing U.S. trade agreements, to address RDP failures in bilateral forums and to seek and secure RDP commitments in trade agreement negotiations that reflect the high standards found in U.S. law.

C. Localization barriers – A cross-cutting challenge

Like businesses in many other sectors of the U.S. economy, PhRMA members are witnessing a proliferation of acts, policies and practices abroad that are designed to benefit local producers at the expense of manufacturers and their employees in the United States and elsewhere around the world. In several countries, including Argentina, China, India, Indonesia, Russia, Saudi Arabia and Turkey, these localization barriers have become so pervasive that they are now a routine part of many transactions between businesses and governments – from securing patents, regulatory approval and market entry to the most minor administrative formalities.

These discriminatory measures put American jobs at risk and are inconsistent with the most basic principles of the global trading system found in the General Agreement on Tariffs and Trade, TRIPS and the WTO Agreements on Technical Barriers to Trade and Trade-Related Investment Measures. These measures deny adequate and effective
intellectual property protection for biopharmaceutical innovators in the United States and fair and equitable market access for new medicines, vaccines and other health technologies. Some examples of the most serious localization barriers that undermine the ability of PhRMA members to develop and deliver new treatments and cures include:

- **Market entry or other benefits conditioned on local manufacturing.** While many economies provide positive incentives for businesses to conduct research and development and to manufacture in their markets, an alarming number are seeking to grow their economies by discriminating against innovators in the United States and other countries. For example, **Turkey** removed products from the reimbursement list that are not produced in Turkey, only reversing course after a successful WTO challenge by the European Union. **Algeria** prohibits imports of virtually all biopharmaceutical products that compete with similar products manufactured domestically. **Russia**’s Law on the Federal Contract System allows government medicines procurement agencies to ban foreign goods in public procurement tenders. Moreover, Russia is implementing legislation that limits national medicine procurement to manufacturers in the Eurasian Economic Union if there are two or more manufacturers for a particular class of medicine.

- **Mandatory technology transfer.** In **Indonesia** and other countries, local manufacturing requirements are coupled with other policies that directly expropriate sensitive intellectual property and know-how. For example, a foreign biopharmaceutical company may import medicines into Indonesia only if it partners with an Indonesian firm and transfers relevant technology so that those medicines can be domestically produced within five years. Requiring technology transfer to import medicines into Indonesia creates a windfall for domestic firms and artificially distorts the market.

- **De facto bans on imports.** Manufacturing licensing requirements generally are intended to ensure that companies meet globally recognized standards – such as good manufacturing practices (GMP). Some countries exploit these licensing requirements by adopting policies that virtually prevent market entry. For example, **Turkey** does not recognize internationally accepted GMP certifications from other countries unless they have mutual recognition agreements (MRAs) on inspections with Turkey. Given, however, the many steps that would need to be satisfied before an MRA could be pursued between the United States and Turkey, this policy serves as a de facto restriction on imports from biopharmaceutical innovators in the United States. Turkey has stated publicly that the purpose of this policy is to promote Turkish drug companies.

Recent research demonstrates the significant and widespread damage localization barriers can inflict on the global economy and on markets that put such barriers in

---

They cost businesses and their employees in the United States and other leading nations by cutting tens of billions of dollars in global trade and by reducing global income and innovation. They do not increase biopharmaceutical investment or knowledge-intensive employment in countries that adopt localization barriers. In fact, they can even reduce employment – particularly for the less skilled – by raising input costs and severing connections to global value chains.\textsuperscript{137}

PhRMA members appreciate the attention that USTR and other federal agencies have given to localization barriers in previous reports and publications. However, urgent action is needed to remove these barriers and to discourage other countries from adopting similar acts, policies and practices. Biopharmaceutical innovators in the United States look forward to concrete progress and real results in 2023.

III. Addressing Challenges and Securing the Benefits of Biopharmaceutical Innovation

To address these pressing challenges and ensure that biopharmaceutical innovators in the United States can continue to research, develop and deliver new treatments and cures for patients who need them around the world, PhRMA members urge USTR and other federal agencies to take the following five actions. These actions can help ensure access to quality, safe and effective medicines at home and abroad by promoting high standards of protection for patents and regulatory test data, effective enforcement of these and other intellectual property rights and transparent and predictable legal and regulatory regimes.

A. Enforce and defend global, regional and bilateral rules

USTR and other federal agencies should use all available tools and leverage to ensure America’s trading partners live up to their obligations in global, regional and bilateral trade and investment agreements. Negotiating new trade agreements, modernizing and building on existing trade agreements, resisting efforts by trading partners to eliminate or otherwise weaken provisions of existing trade agreements and strengthening enforcement activity will be critical to end discriminatory pricing policies and to address longstanding intellectual property challenges around the world – particularly in

countries that are U.S. trade and investment agreement partners, that have made important unfulfilled WTO accession commitments and that benefit from U.S. trade preference programs.

U.S. regional and bilateral trade agreements affirm globally accepted standards for the patentability of biopharmaceutical and other inventions and require countries to protect regulatory test data, provide mechanisms that enable innovators to resolve patent disputes prior to the marketing of potentially infringing products and establish a stronger intellectual property framework. Some also include government pricing and reimbursement and transparency commitments. However, Australia, Canada, Chile, Colombia, Korea, Mexico and other U.S. trading partners fail to adequately comply with some or all of these obligations. USTR and other federal agencies should consider a process to systematically review compliance with trade and investment agreements and to take steps necessary to ensure that countries abide by rules to which they have agreed.

On joining the WTO in 2001, China committed to provide six years of protection for clinical test and other data submitted for regulatory approval of biopharmaceutical products containing a new chemical ingredient.138 China has never implemented this obligation, despite agreement to do so during the 2012 U.S.-China Joint Commission on Commerce and Trade meeting.139 In light of these deficiencies, we strongly welcomed the CFDA draft Circular 55 (Relevant Policies on Protecting Innovators’ Rights to Encourage New Drug and Medical Device Innovation) and draft “Implementing Provisions on Protection of Drug Trial Data” (April 2018), which propose up to twelve years of RDP for therapeutic biologics, orphan and pediatric medicines and six years of RDP for new small molecule drugs. These proposals represent a strong first step toward reform in this area, but it is now imperative that these proposed policy revisions are transparently and expeditiously implemented in a manner that provides for effective protection for U.S. biopharmaceutical companies and is consistent with international best practices and China’s renewed commitment to provide RDP as affirmed in the chapeau to Section C of Chapter One of the U.S.-China Economic and Trade Agreement.

In the United States-Taiwan Initiative on 21st-Century Trade First Agreement, announced in May 2023, Taiwan made commitments to adhere to a variety of good regulatory practices, including transparent development of regulations. However, Taiwan continues to administer certain pricing and reimbursement processes concerning medicines in manners that conflict with these commitments. PhRMA member companies are concerned about the lack of transparency and due process in Taiwan’s pricing and reimbursement processes, including the use of heath technology reassessments and managed entry agreements. As the parties prepare for the Agreement’s entry into force, the United States should ensure that Taiwan promptly implements these commitments to

---

remedy these deficiencies to promote certainty for U.S. businesses operating in Taiwan and to improve patient access to innovative medicines.

Although not currently authorized, the Generalized System of Preferences (GSP) program generally provides unilateral duty-free access to the U.S. market for approximately 3,500 products. Before granting GSP benefits to an eligible country, the President must take into account a number of factors, including the extent to which the country is willing to “provide equitable and reasonable access to its markets” and is “providing adequate and effective protection of intellectual property rights.” However, multiple traditional GSP beneficiaries, including Argentina, Brazil and Indonesia, do not provide adequate and effective protection of intellectual property rights or fair and equitable market access.

The National Trade Estimate Report is an important tool to identify and prioritize acts, policies and practices in these and other overseas markets that are harming America’s creative and innovative industries by denying adequate and effective intellectual property protection and fair and equitable market access. PhRMA members urge USTR and other federal agencies to ensure that this tool is used effectively.

The Special 301 Report likewise is an important tool. Action plans required by the Trade Facilitation and Trade Enforcement Act of 2015 should be developed for countries listed on the Priority Watch List with input from relevant stakeholders. Out-of-cycle reviews announced in the Special 301 Report should be conducted and involve the participation of relevant stakeholders.

USTR should pursue a variety of enforcement initiatives, including – but not limited to – the filing of dispute settlement cases to secure compliance with trade and investment agreement commitments. In addition, USTR should create and fill key positions. To that end, PhRMA and its member companies encourage the President to nominate a Chief Innovation and Intellectual Property Negotiator, as required by the Trade Facilitation and Trade Enforcement Act of 2015 (TFTEA). According to TFTEA, the “principal functions of the Chief Innovation and Intellectual Property Negotiator shall be to conduct trade negotiations and to enforce trade agreements relating to United States intellectual property and to take appropriate actions to address acts, policies and practices of foreign governments that have a significant adverse impact on the value of United States Innovation.” TFTEA states further that the “Chief Innovation and Intellectual Property Negotiator shall be a vigorous advocate on behalf of United States innovation and

---

143 Id.
intellectual property interests.” PhRMA encourages USTR to pursue and accomplish these statutory objectives.

**B. Secure strong commitments in global, regional and bilateral negotiations**

Global, plurilateral and bilateral trade and investment negotiations provide critical opportunities to build on the existing foundation of international rules and to secure commitments necessary to drive and sustain 21st century biopharmaceutical innovation. Ending discriminatory pricing policies, eliminating restrictive patentability criteria, addressing unreasonable patent examination and approval delays, providing for the early and effective resolution of patent disputes, ensuring robust protection of regulatory test data and reducing unnecessary regulatory barriers can promote biopharmaceutical innovation and improve market access. Unfortunately, the Administration has demonstrated limited ambition in further advancing, or even maintaining, these important policies internationally. Instead, USTR has departed from longstanding and bipartisan U.S. trade objectives by deprioritizing, and in certain instances proactively opposing, the very trade policies that best promote U.S. workers.

PhRMA supports trade agreements that include strong protections for intellectual property, ensure fair and equitable market access and enable biopharmaceutical innovators in the United States to export lifesaving medicines to patients around the world. Free and fair trade agreements open new markets. They help grow our economy, create better and higher-paying jobs and safeguard the United States’ global competitiveness. Nevertheless, the Administration has declined to negotiate new comprehensive and high-standard trade agreements with well-positioned and willing partners. Remarkably, USTR has elected not to pursue a world-leading and precedent-setting agreement even with the United Kingdom, a like-minded partner, one of America’s greatest allies and a country with very high labor, environmental and other standards. This decision is a major and incomprehensible error that imposes great costs on America’s workforce, including the diverse researchers, inventors and manufacturers that compose the U.S. innovative biopharmaceutical industry and that would benefit from the increased U.S.-UK scientific and economic collaboration that would result from an ambitious bilateral trade agreement.

The Administration’s failure to take steps toward U.S. participation in and improvement of the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) is another missed opportunity to advance U.S. biopharmaceutical innovation and market access in critical markets and to work with global CPTPP partners, such as the United Kingdom, to strengthen international IP and other standards. U.S. participation in and improvement of the CPTPP would provide valuable opportunities to advance IP protections and address market access barriers facing America’s biopharmaceutical innovators, including in key markets such as Australia, Japan, Malaysia, New Zealand and Vietnam. Dialogues such as the Indo-Pacific Economic Framework (IPEF), which exclude the ambition to deliver strong market access, IP and

144 Id.
regulatory commitments, are no substitute for U.S. leadership in comprehensive global trade agreements such as the CPTPP.

Discussions in the WTO regarding trade and health present another important opportunity to address trade barriers that undermine U.S. biopharmaceutical innovation and exports, such as high tariffs on imported medicines in markets such as Argentina, Brazil, India and Thailand. Throughout the COVID-19 pandemic, our industry encouraged the United States and other WTO Members to formalize and pursue a robust trade and health agenda to address and resolve the multiple trade barriers that impeded, and continue to impede, access to medicines, including tariffs, export restrictions and customs barriers.145 Multiple WTO Members, including geographically diverse countries at various levels of economic development, advanced constructive proposals along these lines, including proposals to eliminate tariffs, discipline export restrictions, enhance regulatory cooperation and improve trade facilitation measures.146 Additional support for such initiatives was voiced in other international fora – including the G7 and the G20 – well in advance of the WTO’s decision to waive certain commitments to protect IP on COVID-19 vaccines under the TRIPS Agreement.147 The U.S. Administration unfortunately failed to meaningfully support these initiatives and, absent U.S. leadership in these areas, the WTO’s Twelfth Ministerial Conference produced no concrete commitments to reduce or eliminate any of these trade barriers, while adopting the TRIPS waiver on COVID-19 vaccines.

Regrettably, those trade dialogues in which the Administration has engaged are unambitious, limited by design and disappointing. These include the U.S.-EU Trade and Technology Council (TTC), the IPEF, the Americas Partnership for Economic Prosperity and multiple bilateral dialogues. These dialogues exclude ambitions to deliver strong market access, IP and regulatory commitments that advance scientific research, incentivize invention and production of medicines, and improve the ability of U.S.

146 This includes proposals from the European Union concerning trade facilitation, regulatory cooperation and disciplining export restrictions, and proposals from the “Ottawa Group” to limit export restrictions on medical goods, reduce tariffs and improve trade facilitation, among other proposals. See General Council, Urgent Trade Policy Responses to the COVID-19 Crisis, Communication from the European Union, WT/GC/231 (June 4, 2021) and General Council, COVID-19 and Beyond: Trade and Health, Communication from Australia, Brazil, Canada, Chile, the European Union, Japan, Kenya, Republic of Korea, Mexico, New Zealand, Norway, Singapore and Switzerland, WT/GC/223 (Nov. 24, 2020).

biopharmaceutical manufacturers to export medicines to patients throughout the world. Increasing the level of ambition in these dialogues could help to expand export opportunities for U.S. biopharmaceutical innovators, including to major economic markets as well as large growing markets such as Indonesia and the Philippines where trade and regulatory barriers significantly limit patient access to innovative medicines. The U.S. Government should recommit to pursuing economically meaningful trade policies, concentrating on high-impact commercial opportunities, and demonstrating ambitious global trade leadership.

To expand economic opportunities for the U.S. workforce engaged in biopharmaceutical research, invention, and manufacturing, the U.S. Government should engage more ambitiously with trading partners to negotiate and conclude comprehensive trade agreements that eliminate and address unfair trade barriers abroad. PhRMA members desire to work more closely with USTR and other federal agencies to modernize, build on and enforce existing trade agreements and to consider opportunities to further improve public health and grow American manufacturing exports and jobs through additional trade agreements, including with leading U.S. biopharmaceutical export markets.148

C. End discrimination in pricing and reimbursement

PhRMA members are, and seek to be, partners in solutions to health care challenges facing patients and their communities around the world. However, some governments have proposed or implemented pricing and reimbursement policies that discriminate against medicines made in America, do not appropriately value innovation and lack predictable, transparent and consultative processes. As stated above, such measures can undermine the ability of biopharmaceutical innovators to bring new medicines to patients who need them and to invest in future treatments and cures.

The biopharmaceutical industry is unique in that most foreign governments, as sole or primary health care providers, impose burdensome and often discriminatory price controls and regulations on the sector. Others have resorted to improperly using national compulsory licensing provisions to threaten or coerce manufacturers to accept pricing agreements on unreasonable commercial terms and conditions. As a result, market access for pharmaceuticals is dependent not only on innovators meeting strict regulatory approval standards and obtaining necessary intellectual property protections, but also on obtaining positive government pricing and reimbursement determinations. It is imperative, therefore, that regulatory procedures and decisions regarding the approval and reimbursement of medicines are governed by fair, transparent and verifiable rules guided by science-based decision making. There should be meaningful opportunities for input from manufacturers and other stakeholders to health authorities and other regulatory agencies and a right to appeal government pricing and reimbursement decisions to an independent, objective court or administrative body.

The U.S. Government can play a critical role in ensuring transparency and due process of pricing and reimbursement policies, as well as in highlighting the global benefits to patients that result from a reduction in trade barriers. The Medicare Prescription Drug, Improvement and Modernization Act of 2003 called for the Administration to develop a strategy to address foreign price controls on pharmaceuticals and related practices through bilateral and multilateral trade negotiations. PhRMA believes that the cornerstone of any such strategy must be a proactive U.S. trade policy focused on: (i) addressing discriminatory government price controls and related practices and (ii) highlighting the global benefits for patients from the potential groundbreaking research that could result from a reduction in key trade barriers. Unfortunately, governmental policies around the globe over the last year have continued to harm patient access to innovative medicines.

PhRMA members appreciate steps USTR and other federal agencies have taken to ensure fair and equitable market access for innovative medicines in overseas markets, including seeking and securing commitments in trade agreements that ensure pricing and reimbursement policies abroad are fair, reasonable and non-discriminatory, and appropriately value patented pharmaceuticals. PhRMA urges USTR and other federal agencies to promote the full implementation of these commitments and to build on them in future trade negotiations by insisting that future trade agreements ensure that government regulatory reimbursement regimes are transparent and non-discriminatory and provide procedural fairness and full market access for United States products.149

In particular, proposed laws, regulations and procedures concerning how medicines are approved, priced and reimbursed should be:

- Promptly published or otherwise made available to enable interested parties to become acquainted with them.
- Published prior to adoption in a single official journal of national circulation, with an explanation of the underlying purpose of the regulation. In addition, interested parties (including trading partners) should be provided a reasonable opportunity to comment on the proposed measures. Those comments and any revisions to the proposed regulation should be addressed in writing at the time that the agency adopts its final regulations. Finally, there should be reasonable time between publication of the final measures and their effective date so that the affected parties can adjust their systems to reflect the new regulatory environment.

In turn, specific regulatory determinations or pricing and reimbursement decisions should be:

- Based on fair, reasonable, consistent and non-discriminatory procedures, rules and criteria that are fully disclosed to applicants.

149 See, e.g., Section 102(b)(7)(G) of the Bipartisan Congressional Trade Priorities and Accountability Act of 2016 (P.L. 114-26).
• Completed within a reasonable, specified timeframe. In some countries, there are no deadlines for making decisions on whether to approve new medicines. In others, deadlines exist, but are regularly not met. These delays impede market access, deplete the patent term and are detrimental to patients waiting for life-saving medicines.
• Conducted so that they afford applicants timely and meaningful opportunities to provide comments at relevant points in the decision-making process.
• Supported by written reports which explain the rationale for the decision and include citations to any expert opinions or academic studies relied upon in making the determination.
• Subject to an independent review process.

D. Combat the worldwide proliferation of counterfeit medicines

PhRMA members view counterfeit medicines as a critical public health and safety concern threatening patients around the world. Counterfeit medicines may deprive patients of the medicines they need and contribute to drug-resistant forms of tuberculosis and other serious diseases and contain impurities or toxins that can cause harm or even death.\(^{150}\) This challenge is exacerbated by the ease with which counterfeiters can offer fake medicines over the Internet\(^ {151}\) and ship them by mail\(^ {152}\) to patients and consumers worldwide.\(^ {153}\) Unfortunately, the pandemic has provided yet another arena in which counterfeiters have sought to profit from unsuspecting consumers.\(^ {154}\) The TRIPS waiver

\(^{152}\) An OECD study found that more than 60 percent of counterfeit goods seized around the world between 2011 and 2013 were shipped by mail or express carrier. OECD, “Trade in Counterfeit and Pirated Goods: Mapping the Economic Impact,” 2016, available at https://read.oecd-ilibrary.org/governance/trade-in-counterfeit-and-pirated-goods_9789264252653-en#page1 (last visited Oct. 21, 2023).

will only exacerbate the situation by fostering the proliferation of counterfeit COVID-19 vaccines.

Counterfeit medicines are a potential danger to patients everywhere, including in the United States. During 2022, the Pharmaceutical Security Institute documented more than 6,600 incidents of pharmaceutical crime in the United States.\textsuperscript{155} Across all sectors, the Organization for Economic Cooperation and Development (OECD) found that global counterfeiting and piracy accounts for 2.5 percent of world trade and disproportionately harms innovators in the United States.\textsuperscript{156} PhRMA and its members welcomed the proactive launch and implementation of “Operation Stolen Promise 2.0” by the U.S. Department of Homeland Security in April 2020 to address COVID-19-related fraud and criminal activity, including the illicit sale and distribution of counterfeit or unauthorized vaccines and treatments.

\textbf{China} is the leading source of fake medicines seized at ports of entry in the United States\textsuperscript{157} and elsewhere,\textsuperscript{158} though many other jurisdictions are involved – particularly in online sales.\textsuperscript{159} According to the WHO, regions where protection and enforcement systems are weakest also see the highest incidence of counterfeit medicines. In these jurisdictions and others, customs and other law enforcement officials often are not able to seize counterfeit medicines, particularly goods in transit, goods in free trade zones and goods offered for sale on the Internet. Violations of limited laws on the books often are not effectively enforced or do not come with sufficient penalties to deter counterfeiting.\textsuperscript{160}

PhRMA members companies work to maintain the safety of their manufacturing facilities and the security of their global supply chains. They currently employ and routinely enhance a variety of anti-counterfeiting technologies, including covert and overt features on the packaging of high-risk prescription medicines. They have adopted a range of business processes to better secure prescription drug supply chains and facilitate the

early detection of criminal counterfeiting activity. They partner with law enforcement officials around the world.

To combat the global proliferation of counterfeit medicines and active pharmaceutical ingredients, PhRMA supports strengthening training and collaboration with U.S. trading partners to adopt and implement a comprehensive regulatory and enforcement framework that: (i) subjects drug counterfeiting activity to effective administrative and criminal remedies and deterrent penalties; (ii) adequately regulates and controls each link in the legitimate supply chain; (iii) trains, empowers and directs drug regulators, law enforcement authorities and customs to take effective and coordinated action, including against exports and online activity; and (iv) educates all stakeholders about the inherent dangers of counterfeit medicines.

**E. Build and strengthen global cooperation**

Finally, PhRMA members urge USTR and other federal agencies to further build and strengthen partnerships with countries around the world that also have a critical stake in a strong and effective intellectual property system that values and protects innovation. Federal agencies should promote full implementation and ensure effective enforcement of global, regional and bilateral commitments and support training of regulators, law enforcement officials, judges and other court personnel overseas to enforce those commitments.

PhRMA members appreciate the steps that USTR and other federal agencies have taken to strengthen cooperation with other governments. Bilateral forums like the Transatlantic IPR Working Group have helped to build understanding and to identify and advance common priorities. They can be a model for similar engagement with other countries, particularly those which are parties to Trade and Investment Framework Agreements. The network of PTO intellectual property attachés around the world is a vital resource for American inventors and should be expanded. Cooperation between PTO and other leading patent offices through the PCT, the IP5 and PPH programs is cutting costs, improving the efficiency of patent examination in overseas markets and helping to reduce stubbornly high patent examination backlogs.

All this provides a valuable foundation on which to build in the coming year and beyond. PhRMA members believe that strengthening such coalitions will be particularly critical in multilateral organizations that advise countries and provide assistance on policies related to global trade, intellectual property and pharmaceutical markets. Organizations such as the WTO, the WHO, UNDP, UNCTAD and the World Intellectual Property Organization (WIPO) often focus their work inappropriately on limitations and exceptions to intellectual property rights, as well as promote a range of harmful policies that would undermine vital incentives for innovation. For example, WHO’s Roadmap on Access to Medicines envisions providing “technical support” to countries that intend to engage in compulsory licensing,\(^{161}\) with one regional WHO office openly asserting that

compulsory licensing is “important and to be encouraged.” Unitaid has directed millions of dollars to programs that seek to weaken intellectual property laws and lobby governments to reject provisions in international trade agreements that would strengthen innovation incentives.

Similarly, despite being a member-driven organization in which policy proposals are supposed to be advanced by Member States, the WTO inappropriately submitted an “outcome document” concerning “an intellectual property response to COVID-19” to the WTO Membership for consideration; most of the provisions of this “outcome document” were later adopted by the WTO Membership and incorporated into the TRIPS waiver. Meanwhile, the WHO Director-General publicly supported the even more extreme original proposal at the WTO TRIPS Council to waive entirely certain international obligations with respect to COVID-19 technologies, even as Member States were debating that proposal at the WTO – a separate multilateral forum.

The United States must recommit to serious leadership in these and other organizations. Such leadership is essential to preventing these organizations from weakening or even eliminating the intellectual property protections that drive America’s innovation economy. As the leading funder of many multilateral organizations, the United States must remain vigilant in these forums and work with other like-minded countries to advocate for robust intellectual property protection and fair and equitable market access. Federal agencies should ensure that intellectual property matters are addressed in organizations with the appropriate mandate and expertise, and with full visibility of the organization’s Member States. The U.S. Government should strengthen interagency coordination and ensure that officials with intellectual property expertise are part of U.S. delegations to relevant global meetings. U.S. leadership can help to ensure that all stakeholders, including those in the private sector, are able to contribute to discussions in multilateral organizations on relevant topics.

ALGERIA

PhRMA and its member companies operating in Algeria remain concerned about longstanding market access and intellectual property challenges that discourage investment in biopharmaceutical innovation, restrict patient access to new medicines and fail to address the unmet medical needs of the country. Despite deterioration in the overall business and investment environment, PhRMA member companies seek cooperative engagement with the government to address the following key challenges.

Key Issues of Concern:

- **Import restrictions and forced localization**: Algeria prohibits imports of specific biopharmaceutical products that compete with similar products manufactured domestically. Only products included on both a list of essential medicines and the list of reimbursed medicines are allowed to be imported. Finished medicines and active pharmaceutical ingredients (APIs) that are not locally manufactured are subject to annual import quotas. In addition, Algeria enforces monetary limits on biopharmaceutical imports via drastic price cuts and limits the registration and reimbursement of new medicines. In 2021, the Algerian Government reduced spending on medicines by 25 percent through discriminatory price reductions and restrictions on imports.

- **Weak patent enforcement and regulatory data protection failures**: Algeria has inadequate patent protection, ineffective mechanisms to enforce patents and does not grant regulatory data protection (RDP). Judicial training to handle complex patent disputes would greatly assist in improving the patent enforcement environment in Algeria. PhRMA appreciates recent meetings hosted by the Ministry of Pharmaceutical Industry (MoPI) during which they expressed willingness to work with the industry to improve patent enforcement in Algeria.

- **Discriminatory investment and commercial laws**: Algeria imposes several restrictions on the business operations of biopharmaceutical companies operating in Algeria. In 2018, the Algerian Government suspended license renewals for companies operating through representative offices, in effect forcing them to be represented by local companies. Subsequently, Executive Decree No. 21-82 published in February 2021 restricted non-licensed, non-local establishments from engaging in the manufacturing, importation, exportation or wholesale distribution of medicines without prior approval.

- **International reference pricing**: Algeria’s international reference pricing (IRP) regulations have historically been among the most onerous in the world. A pricing policy issued in December 2020 addressed some concerns, but the IRP regulations, especially the use of the lowest price among reference basket countries rather than the average or median price, still greatly reduces the availability of new medicines for patients in Algeria.
• **Cumbersome and slow regulatory system:** Algeria has implemented additional burdensome requirements for obtaining marketing authorization for biopharmaceutical products, especially innovative medicines. As a result, patient access to innovative medicines in Algeria lags significantly behind peer countries.

• **Hospital procurement:** Patient access to hospital medicines occurs through centralized tendering, which takes place every three to four years. Innovative medicines that were registered in 2017 were not included in hospital tenders until 2022. The centralized tender process limits negotiations with payers and thereby reduces patient access to new medicines. In November 2022, the Central Pharmacy of Hospitals, PCH, imposed a separate contract for innovative medicines in order to regulate the budget.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Weak Patent Enforcement**

Marketing approval authorities in Algeria improperly interpret current laws and regulations by granting marketing approval to potentially patent infringing follow-on products while relevant patent(s) are still in effect. Despite patent owners’ repeated attempts to alert Algerian authorities, Algeria’s marketing approval agency has approved potentially infringing follow-on products many years in advance of the original product patent expiration.

Compounding these actions, effective judicial remedies are not available to prevent infringement of patent rights. Because the current patent law does not include any possibility for preliminary injunctions, Algerian courts are significantly limited in their ability to provide injunctive relief that could prevent irreparable harm prior to the resolution of the patent dispute, thus placing originators in an untenable position with no possibility to fully defend their rights. Violations of Algerian patents that have occurred in recent years have still not been corrected.

**Regulatory Data Protection Failures**

Algeria does not protect regulatory test and other data from unfair commercial use and disclosure. Algeria should correct this deficiency through implementation of meaningful RDP.
Market Access

Import Restrictions and Forced Localization

Algeria has implemented additional burdensome requirements for obtaining marketing authorization for biopharmaceutical products, especially innovative medicines. Despite some improvements in the MoH’s registration process since 2013 and recent structural changes to MoH’s engagement with the biopharmaceutical industry, the registration process remains slow and is now falling further behind positive regulatory reform trends in the region (i.e., in Egypt and Saudi Arabia). In those countries, new review procedures are expected to significantly reduce the time it takes to register new medicines by 90 percent. This will accelerate marketing authorizations and enable patients to access promising new treatments in as little as 30 to 60 days after those new medicines are approved for use in Europe or the United States. Algeria should adopt similar review procedures to expedite patient access to innovative medicines.

The agencies responsible for drug registration processes in Algeria have been reorganized under MoPI with the goal of streamlining the drug registration. However, these agencies still lack sufficient resources and staffing to handle the current backlog in drug registration, price approval and testing on importation. For new drug applications, no assessment of pre-submissions has taken place since September 2018. Additionally, 700 new applications of originator medicines have been submitted and are pending registration due to a lack of quality testing capabilities. Since June 2010, biopharmaceutical companies have noticed longer delays by many months in approving variations of imported products already available on the market.

In addition, the biopharmaceutical industry continues to face significant and growing access challenges within the Reimbursement Committee (CRM) process led by the Ministry of Labor (MoL). Manufacturers are required to enter separate reimbursement negotiations with CRM and the new lower price must then be re-approved by the MoH. These combined procedures are inefficient, redundant and unfair to innovative biopharmaceutical companies. Unfortunately, even with the creation of MoPI, the process has not been improved. There remains no established timeline between the first submission to CRM of the reimbursement dossier and the application at the pharmacy level. While the intent of the MoL is to reduce the maximum number of products on the list of reimbursable products, this particularly impacts imported products such that a new innovative medicine has a very low chance of being reimbursed.

Industry is hopeful that the reorganized MoPI, which is responsible for all aspects of regulating the sector, will be better positioned to improve the regulatory environment in Algeria. The new decree published in 2020 brought more clarity and transparency in term of timelines and process. The main three focus areas of the new decree are shorter registration timelines of 150 days, reliance model implementation and on-site assessments, and fast track registration of orphan drugs and other products listed in the National Plan. To date, however, no action has been taken.
ARGENTINA

PhRMA and its member companies operating in Argentina continue to face longstanding market access barriers and serious intellectual property (IP) issues. While the previous administration had signaled willingness to address significant IP concerns related to patentability and regulatory data protection (RDP), no reforms were initiated and IP issues remain a concern. Regulatory reforms by the sanitary authority that brought Argentina closer to international standards and reduced clinical trial approval times are already attracting investment in early phase trials. Although general registration and evaluation regulations for biopharmaceutical products exist, some complementary regulations are missing and the established evaluation deadlines are not being met, thus generating legal and business uncertainty for PhRMA member companies.

Key Issues of Concern:

- **Restrictive patentability criteria:** The Argentine Government amended its criteria for granting pharmaceutical patents in 2012. A joint regulation issued by the Ministries of Health and Industry and the Argentina Patent Office (Instituto Nacional de la Propiedad Industrial or INPI) significantly limits the type of pharmaceutical inventions that can be patented. These guidelines are contrary to Argentina’s obligations under the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) and have led to the rejection of many pharmaceutical patent applications.

- **Regulatory data protection failures:** Argentina does not provide protection for regulatory test data, as required under TRIPS. Specifically, Law 24,766 and Decree 150/92 permit Argentine officials to rely on data submitted by originators to approve requests by competitors to market similar products.

- **Compulsory licensing:** On December 21, 2019, the Argentine Congress passed economic emergency legislation that, among other things, raises the risk of compulsory licenses of patents in Argentina. Article 70 of the new law empowers the Ministry of Health to establish a mechanism to monitor the prices of medicines and to utilize measures such as compulsory licensing against “problems of availability or unjustified or irrational price increases.”

- **Flawed cost containment measures:** During 2021, the Argentine Government made several statements regarding their plans to establish price controls for “high-cost” medicines through international reference pricing (IRP), which limits the flexibility and adaptation of prices to local market conditions and harms patient access to innovative medicines.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.
Intellectual Property Protection

Restrictive Patentability Criteria

In 2012, the Argentine Government published a regulation that significantly narrowed the scope of chemical compounds and compositions that can be patented, leading to the rejection of many pharmaceutical patent applications. The regulation contemplates that similar limitations could be added in the future for “pharmaceutical biological inventions.”

The regulation (Nos. 118/2012, 546/2012 and 107/2012), issued jointly by the Ministries of Health, Industry and INPI sets out Guidelines for Patentability Examination of Patent Applications on Chemical and Pharmaceutical Inventions. It expressly states that pharmaceutical patents are not available for compositions, dosages, salts, esters and ethers, polymorphs, analogous processes, active metabolites and pro-drugs, enantiomers and selection patents. Also, the ability to describe and claim an invention using Markush-type claims is severely limited.

The imposition of additional patentability criteria for pharmaceutical patents beyond those of demonstrating novelty, inventive step and industrial application is arbitrary and inconsistent with Articles 1 and 27.1 of TRIPS, as well as Argentina’s obligations under its bilateral investment treaty with the United States.\(^{166}\) While the prior Argentine administration recognized that the guidelines and resolution are problematic, it did not take action to reform them and the current administration has not indicated that reform is part of its political agenda.

In 2015, INPI passed Resolution 283/2015 which narrows the patentability of certain biotechnological inventions, including inventions based on nucleotide or amino acid sequences. The resolution also expands the scope of subject matter that is not patentable to include genetically modified organelles. These and other restrictions in Resolution 283/2015 potentially create an unprecedented class of inventions that are excluded from patentability.\(^{167}\)

Regulatory Data Protection Failures

Biopharmaceutical innovators work with hospitals, universities and other partners to rigorously test potential new medicines and demonstrate they are safe and effective

\(^{167}\) On June 6, 2012, CAEMe, joined by over 40 innovative biopharmaceutical companies, filed an administrative petition seeking to invalidate the Joint Resolution. That administrative review petition was dismissed in 2013. Following that dismissal, CAEMe filed a civil complaint in federal court challenging the Joint Resolution, the dismissal of the administrative petition and the application of the Patent Examination Guidelines. That complaint is still pending.
for patients who need them. Less than 12 percent of medicines that enter clinical trials ever result in approved treatments.\textsuperscript{168}

To support the significant investment of time and resources needed to develop test data showing a potential new medicine is safe and effective, governments around the world protect that data submitted for regulatory approval from unfair commercial use for a period of time. WTO members considered such protection so important to incentivize biopharmaceutical innovation that they established a TRIPS provision (Article 39.3) requiring each country to safeguard regulatory test data for a period after the approval of a new medicine in that country.

Argentina was among the countries that crafted that provision, but has so far failed to provide protection of test and other data in a manner consistent with its international obligations. Indeed, Law No. 24,766 and Decree 150/92 allow Argentine officials to rely on data submitted by innovators in other markets to approve requests by competitors to market similar products in Argentina. The Law provides no period of protection against reliance and does not define key terms including “dishonest” use.

Weak Patent Enforcement

A critical tool to protect against irreparable harm from the loss of IP is the ability to seek a preliminary injunction to prevent the sale of an infringing product during litigation. Preliminary injunctions become all the more important when there are no other effective mechanisms to facilitate early resolution of patent disputes.

Articles 83 and 87 of Law No. 24,481 on Patents and Utility Models provide for the grant of preliminary injunctions. These Articles were amended in 2003 by Law 25,859 to fulfill the terms in the agreement to settle a dispute between the United States and Argentina (WT/DS171/13). The agreed-upon terms were intended to provide, under certain conditions, effective and expeditious means for patent owners in Argentina to obtain relief from infringement before the conclusion of an infringement trial. Unfortunately, these terms, as implemented in the Argentine legal system, have not had the intended effect. Member companies have reported that the process of obtaining injunctive relief has become very lengthy and burdensome, thereby denying the relief that they were intended to provide.

A more transparent regulatory process whereby the receipt of regulatory submissions is published on an official website would help companies to anticipate and mitigate potential patent infringements. Regulatory approvals are only made public at the end of the process, but they are mostly published after delays and sometimes even after the marketing authorization is granted.

Further, the procedures for enforcing patents and seeking damages are ineffective due to the lengthy judicial process and inadequate damages awards that do not make the patent holder whole. These impediments eviscerate the value of patents in Argentina.

Compulsory Licensing

Among other things, the economic emergency law passed by the Argentine Congress in December 2019 (Law No. 27,541 on Social Solidarity and Productive Reactivation) empowers the Ministry of Health to establish a compulsory or mandatory licensing mechanism, or to directly import certain medicines, to address potential problems caused by unjustified or unreasonable price increases that affect the population’s access to medicines in a way that could put their health at risk.

Empowering the Ministry of Health to establish new mechanisms of compulsory licensing will undermine the incentives for innovators to develop and bring new therapies to Argentine patients, and will lead to greater uncertainty and potential legal challenges. Moreover, such a mechanism appears to encourage additional use of compulsory licensing in a manner that will not only undermine patient access to new medicines but also appears inconsistent with Argentina’s international obligations.

Most recently, in July 2022, Argentina’s Congress passed Law 27,675 on a comprehensive national response to HIV, viral hepatitis, tuberculosis and other sexually transmitted diseases. That law reaffirms the use of compulsory licensing and the use of “safeguards available in the TRIPS Agreement in accordance with the provisions of Law 24,481, its regulations and complementary norms, which allow guaranteeing the sustainability of the treatments”.

As a general matter, CLs should only be used in extraordinary circumstances as a last resort rather than standard government practice. CLs are not a sustainable or effective way to address health care needs. Voluntary arrangements independently undertaken by member companies better ensure that current and future patients have access to innovative medicines.

Patent Backlogs

The ability to secure a patent in a reasonable period is critical to attracting investment in the research and development needed to create new medicines and bring them to patients who need them. Patent backlogs hinder innovation by creating uncertainty and significantly raising investment risk.

Patent application delays can be lengthy in Argentina, where life science innovators wait an average of 6.6 years for patents to be granted.169 According to some estimates, the overall patent backlog is approximately 21,000 applications. Argentina’s

patent law does not provide for patent term adjustments to compensate for unwarranted delays in the examination of patent applications. Although the Argentine Patent Office implemented a Patent Prosecution Highway (PPH) mechanism under Regulation P-56/2016 in order to accelerate the examination process, restrictions on the application of this mechanism make it inapplicable for patent applications covering key pharmaceutical innovations.

To address this challenge, Argentina should open the PPH mechanism to all inventions, including innovative biopharmaceutical products. In addition, Argentina should accede to the Patent Cooperation Treaty (PCT), a step that would facilitate the filing and examination of patent applications in Argentina as it does now in more than 152 Contracting Parties. While the Argentinian Congress has long-considered accession to the PCT, no action has been taken. Accession to the PCT could allow Argentina to reduce its current patent application backlog and use the PCT system to lower filing costs and reduce the review period for future patent applications. Indeed, it is noteworthy that there are concrete examples where Argentine national institutions, such as the National Scientific and Research Council (Consejo Nacional de Investigaciones Científicas y Técnicas, or CONICET), have established a mechanism to access PCT in order to pursue the recognition of the Argentine inventions in other countries. It is time, therefore, that Argentina extends the benefit of acceding to the PCT to innovators in other countries.

**Market Access**

**Flawed Cost Containment Measures**

Since the Argentine midterm primary elections on September 12, 2021, members of the Argentine Government have made several statements regarding their plans to establish price controls for “high-cost” medicines using IRP. As a general matter, IRP suffers from serious flaws as a mechanism for biopharmaceutical pricing. It assumes similarity across all countries in the reference basket and implicitly imports the pricing policies of those countries without accounting for circumstances that justify price differentiation. Importantly, IRP ignores the local value of the product by ignoring the local standard of care, patterns of disease burden and socioeconomic factors. IRP also imports circumstances unrelated to a product’s value, such as budget overruns in reference countries that lead to price cuts. For these reasons, the biopharmaceutical industry does not consider IRP appropriate for achieving competitive prices and improving patient access to innovative medicines in Argentina. Only 30 percent of new medicines launched globally since 2012 are available in Argentina, compared to 85 percent in the United States.\(^{170}\) Argentine patients wait an average of 33 months after global first launch for new medicines to become available, compared to only 4 months in the United States.\(^{171}\)

---

\(^{171}\) Id.
Discriminatory Reimbursement Policies

On October 1, 2015, the Ministry of Health and the Secretary of Commerce issued Joint Resolutions 1710 and 406, which establish a preferential reimbursement system for locally manufactured versions of “high-cost” medicines. These resolutions provide that health insurance agents must give preference to Argentine products available in the market that have the same active ingredient or that are a biosimilar to those originating abroad. This resolution is subject to the condition that the final selling price of the Argentine products must be significantly lower than the average price of similar products of foreign origin.

Key terms remain undefined and while these policies were never applied, the reimbursement system appears to be inconsistent on its face with international biosimilar guidelines (providing that biosimilars cannot be automatically substituted for the original biologic) and Argentina’s national treatment obligations under the WTO General Agreement on Tariffs and Trade.

In addition, provisions of Law No. 27,437 on Buy Argentine and Development of Suppliers further restrict market participation in Argentina for foreign innovators. Foreign companies are required to submit Productive Cooperation Agreement Proposals (ACPs) to participate in public tenders – including details on their relationships with subcontracting companies, direct investment, technology transfer or other capacity building programs. Argentina’s Instituto Nacional de Servicios Sociales para Jubilados y Pensionados (INSSJP), the agency that oversees health insurance for retirees, has also granted preferential commercial conditions in its pharmaceutical purchasing agreements to local products.

On December 27, 2021, the Executive Branch sent a bill to the Argentinian Congress amending Law No. 27,437 to increase the price preference for local manufacturers and explicitly expand the legal regime to procurement by the INSSJP. A technical opinion released by the Committees of Budget and Industry has proposed to exclude INSSJP procurement from the bill, but further Congressional action is pending.
AUSTRALIA

PhRMA and its member companies supported the U.S.-Australia Free Trade Agreement (AUSFTA) ratified by both countries in 2004. The Agreement has contributed to expanded patient access to new medicines in Australia, a key priority for PhRMA member companies. However, we believe there is much more to do to further improve market access as well as protect and strengthen Australia’s intellectual property (IP) regime for new and innovative medicines, which will also serve to foster innovation in Australia’s pharmaceutical and biotechnology sectors – a key priority of the Australian Government. With these concerns in mind, PhRMA recommends that regular meetings of the Medicines Working Group (MWG) resume as a matter of urgency, consistent with Annex 2-C of the AUSFTA; it has been almost 15 years since this MWG last met. While intervening negotiations and meetings may have provided opportunity for our officials to remain in contact, those contacts have been insufficient to address emerging industry issues.

Key Issues of Concern:

- **Difficulties in listing new medicines on the PBS:** PhRMA member companies continue to face challenges and uncertainty in securing positive recommendations from the Pharmaceutical Benefits Advisory Committee (PBAC) to list new medicines on the Pharmaceutical Benefits Scheme (PBS) (or Medical Benefits Schedule (MBS)). Unnecessary supplemental data requests, infrequent PBAC meetings and other administration motions cause significant delays between regulatory approval and reimbursement listing. While the recent New Medicines Funding Guarantee is a welcome improvement, the PBS remains one of the few health programs in the world required to demonstrate a particular standard of cost-effectiveness, and investment remains low in comparison to the overall health budget. Policies such as lowest cost comparator selection, legislated price reductions for innovative therapies and restrictive subsidy caps that can result in prices far below the cost-effectiveness standard do not support investment in innovation and ultimately result in delayed access to innovative medicines for Australian patients. The Health Technology Assessment (HTA) Review, as part of the 2022 Strategic Agreement between Medicines Australia and the Australian Government, provides an opportunity to address the difficulties in listing new medicines on the PBS and improve access for patients.

- **Weak patent law enforcement:** Contrary to its obligations under Art. 17.10(4) of the AUSFTA, Australia has not yet implemented a system by which patent holders, as a matter of practice, receive advance notice of third-party applications for marketing approval of potentially patent-infringing pharmaceutical products. The lack of adequate patent holder notification makes it difficult to resolve patent challenges prior to competitor market entry, creating significant uncertainty for patent right holders. In the rare circumstances where any such advance notice is provided, the amount of notice may be inadequate to enable the final resolution of
any patent infringement claims before the relevant third-party product obtains regulatory approval for market entry during the term of the relevant patent(s).

- **Market-size damages**: In cases of patent invalidation by the courts, the Australian Government has joined legal action against innovators for damages attributed to a delay in the PBS price reduction due to a preliminary injunction on generic launch while the patent dispute is being resolved. These so-called "market-sized damages" create significant uncertainty for pharmaceutical patent owners, who need to be able to rely on the rights conferred by granted patents (unless and until they are finally invalidated). It also undermines the rights of patent holders in Australia by introducing a strong disincentive to exercise their core right to enforce their IP protections and is inconsistent with Australia’s international commitments under the AUSFTA and the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS).

- **Compulsory licensing**: In August 2019, the Government passed amendments to the intellectual property legislation which appear inconsistent with the AUSFTA and which could unnecessarily broaden the scope of compulsory licensing. These amendments could permit compulsory licensing on grounds that are not related to a judicially or administratively determined remedy for anticompetitive behavior, public non-commercial use, a national emergency or other circumstance of extreme urgency as agreed in Article 17.9.7 of the AUSFTA.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Weak Patent Law Enforcement**

Mechanisms that provide for the early resolution of patent disputes before a potentially infringing product is allowed to enter the market are critical to ensuring adequate and effective protection of IP rights for the research-based pharmaceutical sector. Such mechanisms prevent marketing of a product potentially covered by a patent until expiration of the patent or until any dispute relating to infringement or validity of such a patent is resolved. An effective early resolution mechanism provides a procedural gate or safeguard. It ensures drug regulatory entities do not enable the launch of a product which has been asserted to infringe patent rights. In this regard, the Australian Government’s approach is highly concerning to PhRMA members because it encourages unnecessary, costly and lengthy litigation processes. The Australian Government has indicated that it will grant an application to list a competing generic product on the PBS, even when it has received a certificate submitted by the patent holder that:

- patent infringement proceedings in respect of that product have been commenced in good faith;
- the proceedings have reasonable prospects of success;
• the proceedings will be conducted without unreasonable delay; and
• even when a court has granted a preliminary injunction preventing the generic company supplying that generic product.

As indicated above, the AUSFTA provides that when marketing approval is sought by an applicant for a generic product or “product for an approved use,” where the product or approved use is claimed by a patent, the Party (here, Australia) should “provide measures in its marketing approval process to prevent” marketing of the generic product or use during the patent term without consent or acquiescence of the patent owner. Further, if Australia permits a third party to request marketing approval for a product or approved use claimed by a patent identified as claiming that product or approved use, it “shall provide for the patent owner to be notified of such request and the identity of any such other person.”172 This should include a database or other mechanism by which a third party may determine whether there are patents that may be infringed by the product or use for which the third party is seeking approval.

However, originator pharmaceutical companies in Australia generally do not receive any notice of a third party’s intention to enter the market with a product that may infringe a valid and enforceable patent prior to its listing on the ARTG.

Originator companies are significantly impacted when generic medicines enter the market prior to the expiry of the originator patent, in part through mandatory and irreversible price cuts for innovator products listed on the PBS, and through market share erosion. The only legal option available to the innovator patentee to prevent the generic company from launching is to obtain preliminary injunctive relief (or equivalent relief), which in the case of PBS listing must be obtained in the weeks between the time marketing approval of the generic product is published on the ARTG and the next possible PBS listing date, in order to prevent the price reduction. The preliminary injunction process also comes with risk of market-sized damages as discussed below.

Currently, the lack of effective mandatory notification, the absence of an effective mechanism for the early resolution of patent disputes before an infringing product is launched in Australia and the unduly prejudicial penalties being sought by the Australian Government from patent holders for seeking to defend their IP (including liability for market-sized damages as discussed in detail below) significantly weakens the level of IP protection for pharmaceutical innovation in Australia, serving to deprive patent holders of expected benefits under international agreements including the AUSFTA.

In light of these shortcomings, PhRMA welcomes the Australian Government’s response to the 2019 Therapeutic Goods Administration (TGA) consultation on “whether the TGA should publish that a prescription medicine is under evaluation.” In response to public demand for increased information on prescription medicines that are under evaluation, the government has decided to implement enhanced transparency measures for prescription medicines. This includes two broad measures. The first is for the TGA to

172 See Article 17.10(4) of the AUSFTA.
publish a description of major innovator medicine applications that are under evaluation by the TGA. The second measure is subject to the Australian parliament passing legislative amendments that were expected to be introduced in late 2020. These amendments were to “require” that a patent holder be notified by the sponsor of a generic or biosimilar medicine when their application has been accepted for evaluation by the TGA, before the TGA commences the evaluation. This obligation would apply to the first generic or biosimilar medicine listed on the ARTG after the innovator’s medicine.

We look forward to seeing these measures in greater detail, particularly the legislative amendments relating to earlier patent holder notification. If implemented appropriately, the resulting mechanism will benefit not only innovators, but also generics and biosimilar sponsors and the Australian Government alike, by allowing all parties involved to assess, and hopefully resolve, possible patent infringement issues before generic products and biosimilars are launched on the market. We note, however, that the legislation has yet to be introduced into the Australian Parliament, even though it was expected to be advanced in 2020. Medicines Australia will continue to advocate for a full transparency model (i.e., all applications for ARTG registration to be published). PhRMA members will continue to work with the TGA and await the opportunity to review the draft legislation when it becomes available.

Market-Size Damages

Biopharmaceutical innovators must be able to rely on and enforce patents issued by competent government authorities. Laws or policies that allow governments or other non-parties to join a patent dispute to collect “market-size damages” from innovators that pursue unsuccessful patent claims after being granted a preliminary injunction unfairly penalize and discourage the use of provisional enforcement measures as part of well-functioning early resolution mechanisms. These policies undermine legal certainty, predictability and the incentive provided by patents to invest in new treatments and cures.

Australia’s Therapeutic Goods Act, as amended by the legislation implementing the AUSFTA, provides for the award of damages in limited specific circumstances, where a court determines that the patent holder has engaged in improper conduct specifically identified in that legislation in commencing proceedings or seeking a preliminary injunction. Damages under this scheme have not been sought since its introduction. However, outside of that scheme, and pursuant to the usual undertaking as to damages provided by patent holders as a requirement for obtaining a preliminary injunction, since around 2012 the Australian Government has stated its intent to seek – and has sought – market-size damages from biopharmaceutical innovators that have legitimately but ultimately unsuccessfully pursued patent claims. It has done so even where the preliminary injunction was granted several years before the Australian Government first stated its intention to seek such damages. Those claims are purported to compensate the PBS for the effect of any delays in price reductions for patented medicine during the period of a preliminary injunction. The PBS imposes automatic price cuts on medicines

as soon as competing versions are listed on the PBS, but the policy does not include any corresponding mechanism for PBS to reimburse innovators if it is found that those competing versions listed on the PBS were infringing the innovator’s patents.

By pursuing market-size damages, the Australian Government is unfairly tipping the scales in pharmaceutical patent disputes and discouraging innovators from enforcing their granted patents. This policy permits the same court that granted a provisional enforcement measure in a patent dispute to allow that measure to be used as the basis for a claim for compensation by the government or another non-party to the dispute. It exposes innovators to significant additional compensation claims that may be difficult to quantify at the time the preliminary injunction was granted. The punitive size of these additional claims effectively equates legitimate patent enforcement, in circumstances where the market effects of infringing generic entry are difficult to quantify, with patent abuse. Allowing governments or other non-parties to a patent dispute to collect market-size damages undermines legal certainty, predictability and the incentives that patents provide for investment in new treatments and cures. Australia’s practice appears to be inconsistent with the AUSFTA and with WTO intellectual property rules, including with respect to provisional measures.

Indeed, in the course of claiming market-size damages, representatives of the Australian Government have stated that the Australian Government will grant an application to list a competing generic product on the PBS (the effect of which is an automatic price cut), even when:

- the patentee has lodged a certificate, required as a result of the amendments to the Therapeutic Goods Act as a result of the legislation implementing the AUSFTA as a precondition for commencing patent infringement proceedings, stating that infringement proceedings in respect of that product have been commenced in good faith, have reasonable prospects of success and will be conducted without unreasonable delay; and/or

- a preliminary injunction has been granted by a court which prohibits the supply of that product by the generic company.

Such comments typify the disregard paid by the Australian Government to the legitimate interests of innovators in enforcing their granted patent rights.

PhRMA members urge USTR and other federal agencies to prioritize actions to address Australia’s pursuit of market-size damages. The Australian Government should immediately and publicly abandon its policy of seeking market size damages, or any damages, when a patent holder has legitimately sought to enforce its patent rights.

Compulsory Licensing

October 2019 amendments to Australia’s intellectual property legislation on compulsory licensing, including Crown use, are unnecessary, weaken patent protection,
discourage investment and limit the potential benefits of innovation for Australians. These changes may encourage or make it easier for third parties to acquire innovative technologies without authorisation, which could have significant unintended consequences. The amendments could also permit compulsory licensing on grounds that are potentially broader than the circumstances outlined in AUSFTA Article 17.9.7.

Inadequate Regulatory Data Protection (RDP)

Biopharmaceutical innovators work with hospitals, universities and other partners to rigorously test potential new medicines and demonstrate that they are safe and effective for patients who need them. Less than 12 percent of medicines that enter clinical trials ever result in approved treatments.174

To support the significant investment of time and resources needed to develop test data showing that a potential new medicine is safe and effective, governments around the world protect such data submitted for regulatory approval from unfair commercial use for a period of time. Indeed, TRIPS Article 39.3 requires each WTO member to protect undisclosed test and other data submitted for marketing approval in that country against disclosure and unfair commercial use.

RDP is essential for all medicines and is particularly critical for biologic therapies. Made from living organisms, biologics are complex and challenging to manufacture, and may not be protected adequately by patents alone. Unlike generic versions of traditional chemical compounds, biosimilars are not identical to the original innovative medicine such that there can be greater uncertainty about whether an innovator’s patent right will cover a biosimilar version. Without the certainty of some substantial period of market exclusivity, innovators may not have the incentives needed to conduct the expensive, risky and time-consuming work to discover and bring new biologics to market.

Strengthening RDP in Australia – in terms of the length and scope of protection – so it is aligned with global best practice would further enhance Australia’s ability to compete for foreign investments in the knowledge- and innovation-intensive biomedical sector that can drive future economic growth. Australia should implement RDP terms that are consistent with international best practices. Presently, RDP for biologic products in Australia is five years (i.e., the same duration as for small molecule products), in contrast to other markets that provide longer durations for biologic products. In addition, extending RDP for new indications, new formulations, new patient populations and new dosage forms would result in consistency with other markets.

---

Market Access

Difficulties in Listing New Medicines on the PBS

The purpose of the PBS is to provide timely, reliable and affordable access to medicines for all Australians. Prescription medicines accessed via the PBS constitute the vast majority of prescription medicines dispensed in Australia.175 Accordingly, the reimbursement process to obtain PBS listing, as well as PBAC guidelines and decision making, in effect dictate access to the Australian market. Unnecessary supplemental data requests, infrequent convenings of the PBAC and other administration motions cause significant delays between regulatory approval and reimbursement listing. Moreover, HTA and pricing policies such as lowest cost comparator selection, legislated price reductions and subsidy caps that can result in prices below the cost-effectiveness standard do not support investment in innovation and ultimately result in delayed access to innovative medicines for Australian patients. In fact, these policies can have a chilling effect – while 85 percent of new medicines launched globally since 2012 are available in the United States, just 34 percent are available in Australia, with Australian patients waiting an average of 21 months from global first launch for the fewer medicines that do become available. Further, only 24 percent of new medicines are publicly reimbursed by the PBS, taking an average of 47 months from global first launch to PBS listing.176 New medicines listed on the PBS experience delays of over a year, on average, between receiving TGA marketing authorization and PBS listing.177

The PBAC’s approach of comparing new innovative products to the lowest cost comparator, combined with low thresholds for cost-effectiveness, creates an increasingly difficult barrier to patient access. In too many cases, comparators are old, off-patent medicines that are subject to generic or biosimilar competition (and recently some are biosimilars themselves) and have undergone several rounds of price reductions. This practice undermines the intent of Australia’s split F1 and F2 formulary system, which was originally designed to recognize the value of innovation by excluding patented products from the price reductions applied to off-patent products. Today’s innovative medicines offer more personalized and targeted treatments for some of the most serious conditions. Comparing these medicines to older existing medicines that are less complex and developed decades earlier does not represent fair value for the innovation involved and is an additional disincentive to bringing innovative medicines to Australia. Recent activities to provide clarity on this issue have not led to widespread selection of the most appropriate comparator. Industry welcomes the Australian Government’s commitment to

---

address the issue of comparator selection by revising the National Health Act to give PBAC the discretion to select comparators that are not the lowest cost comparator.

In 2017, Medicines Australia signed a five-year Strategic Agreement with the Australian Government to secure greater predictability and stability in the PBS and policy environment. This Agreement was not without significant cost to the industry by cementing the application of a structured series of price reductions for patented medicines in the single-brand F1 formulary at 5-, 10- and 15-years post PBS listing. Additionally, the Agreement aimed to resolve issues with the interpretation of section 99ACB of the National Health Act and committed to no new determination of therapeutic groups during the term of the Agreement.

More recently, a new Strategic Agreement has been struck (in effect as of July 1, 2022), that lessens the statutory price reduction for patented medicines in the single-brand F1 formulary at 10 years and deepens the reduction at 15 years if no generic or biosimilar has entered the market. The application of “catch-up” price reductions in April 2023 will have a significant impact on older medicines in the F1 formulary. However, in turn, the government initiated an independent review of HTA in 2022 and committed to improvements to better reflect the patient perspective. Medicines Australia agreed to initiate an annual horizon scanning forum to highlight the need for modernization and reform of HTA processes and to incentivize innovative technologies launching in Australia. The government also committed to an early and fast review of the discount rate (currently 5 percent) applied to innovative medicines, with a view to meet international best practices.

The current Strategic Agreement is predicted to deliver $1.9 billion (AUD) additional savings to Australia in return for policy and process improvements for the benefit of patients, the Government and the industry. Several issues have arisen with implementation, and the industry is concerned that the Australian Government is not meeting the intent of the Agreement. Any outcome that does not deliver on the intent of the Strategic Agreement will ultimately impact the ability of patients to access innovative medicines.

The industry welcomes the Australian Government’s New Medicines Funding Guarantee for new and amended listings, which commits approximately $2.8 billion in new funding over the next four years for the listing of new medicines on the PBS. Industry also welcomes the government’s reaffirmation that the PBS is an uncapped, demand-driven medicines access system upon which all medicines recommended by the PBAC should be listed, as well as a new commitment to no longer require equal budget offsets for new medicine listings. These changes should help improve the timely listing of new medicines recommended by the PBAC, which remains a major concern.

A House of Representatives Inquiry into the approval processes for new drugs and novel medical technologies resulted in substantial stakeholder interest with over 200 submissions. Issues raised focused on the slow time to access, the importance of access to treatments for rare diseases and the undervaluation of innovation in HTA. The
committee report was published in November 2021 and included many recommendations that are aligned with industry asks. The Australian Government’s response to the report will provide early insight into its views on the upcoming HTA review.

It is important that the PBS and associated PBAC processes streamline and evolve as new and more advanced health technologies become available. Significant progress has been made in consultation with industry to improve regulatory review with the implementation of the Medicines and Medical Devices Review, including new fast-track regulatory pathways such as Priority Review and Provisional Approval. However, there is currently no corresponding change in the HTA and reimbursement system to accommodate these new pathways, although changes could be considered as part of the HTA review initiated in 2022. Industry looks forward to continued work with the Australian Government to implement a fit-for-purpose HTA and reimbursement system to ensure that Australians have timely access to lifesaving and life-changing innovative medicines.

Government-Initiated Post-Market Reviews of PBS Listed Medicines

The Australian Government conducts post-market reviews of PBS-listed medicines to inform decision-making and to improve health outcomes for all Australians.178 While the stated objective of these reviews has been to improve the use of medicines, most reviews have had an imbalanced focus on cost-containment. Industry hopes that considering the statutory price reductions included in the Strategic Agreement, the focus of future post-market reviews will be to improve the quality use of medicines. The Strategic Agreement also aims to reduce the time for these post-market reviews to less than 12 months. Industry and government are working together to design a post-market review system to help meet this goal while retaining transparency and public consultation.

Public Summary Document Changes

The PBAC has implemented new requirements for Public Summary Documents in which it will publish all clinical evidence relied upon by the PBAC to inform its decision-making. The only exception has been for academic-in-confidence information. Unfortunately, however there is a current proposal to remove this protection based on journal editors removing the need for trial data to remain unpublished prior to journal publication. The PBAC does not consider that commercial-in-confidence issues should apply to the publishing of clinical data used for deliberations. While there has been ongoing consultation with the industry on this matter, industry remains concerned that the clinical data redaction criteria are too narrow and may discourage submission of commercial-in-confidence data in PBAC submissions. To that end, industry will proactively monitor this issue to address any unintended consequences or access barriers that arise.

Biosimilars

Contrary to Australia’s goal of fostering a biotechnology industry, the government elected in early 2018 not to implement a unique naming convention for biologic medicines. The new government, elected in 2022, has also made no indications they would implement unique naming conventions. The absence of such a policy has the potential to weaken pharmacovigilance, post-market monitoring and confidence in the introduction of biosimilar medicines. Moreover, the impact of the government’s policy of allowing substitution between biologic and biosimilar products at the pharmacy level, particularly in a health system that does not support unique naming conventions for biological medicines, has not yet been assessed. It will be important to ensure that policies seeking to increase the use of biosimilars do not inadvertently disincentivize or hamper competition and discourage innovative manufacturers of original biologics to enter and remain in the Australian market. PhRMA strongly encourages the Australian Government to deepen consultation with industry as it seeks to develop evidence-based, consistent and comprehensive biosimilars policies that support appropriate use of biologics and biosimilar medicines.
BRAZIL

PhRMA and its member companies operating in Brazil recognize the efforts of the Brazilian Government to liberalize economic opportunities by attracting foreign trade and investment. The Intellectual Property Inter-Ministerial Group (GIPI) is currently analyzing Brazil’s intellectual property (IP) framework and will be recommending particular reforms to address shortcomings in the IP system. It is critical GIPI seize this opportunity and advance key reforms necessary to improve Brazil’s IP regime. For example, Brazil stands in stark contrast to many countries in the region which provide Patent Term Adjustment (PTA), including Chile, Costa Rica, Dominican Republic, El Salvador, Guatemala, Honduras and Nicaragua. The lack of PTA, which is a critical mechanism to compensate for unreasonable delays during the patent examination process, is a pressing priority impacting innovators from all sectors. PhRMA and its member companies support the work of GIPI, and look forward to working with the Brazil government to address not just IP challenges, but also government pricing policies which hinder investment and access to medicines. Brazil’s ambition to join the OECD also presents important near-term opportunities to resolve IP and market access concerns.

Key Issues of Concern:

- **Patent backlogs**: Historically, patent applicants in Brazil have experienced some of the longest patent pendency times in the world. A recent analysis finds that the issue persists today, with the average patent examination timelines for biopharmaceutical patents exceeding 10 years, hindering innovation and significantly raising investment risk. PhRMA is encouraged by the National Institute of Industrial Property’s (INPI) efforts to tackle the examination backlog and improve the efficiency of patent prosecution in Brazil, including expansion of the Patent Prosecution Highway pilot program to all sectors.

- **Lack of regulatory data protection (RDP)**: Brazil does not provide RDP for biopharmaceutical products (despite applying RDP for veterinary, fertilizer and agrochemical products).

- **Compulsory licensing**: Members of Brazil’s National Congress continue to pursue efforts to expand inappropriately compulsory licensing provisions in Brazil’s Industrial Property Law. Recent efforts, such as PL No. 12/2021, included several unprecedented, vague and broad provisions that go beyond what is contemplated in the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). These efforts fundamentally undermine the predictability and certainty necessary for U.S. innovators from all sectors to successfully invest in and accelerate the launch of new products in Brazil.

- **Regressive taxes on medicines**: Combined federal, state and municipal taxes account for 31 percent of the cost of medicines in Brazil, one of the highest tax
burdens on medicines in the world compared to the global average of 6 percent. Currently, there are competing tax reform proposals in the National Congress impacting the biopharmaceutical sector. One proposal from the Executive branch and approved by the Lower House (Bill 2337/2021) would impose new taxes on approximately 18,000 medicines that are currently exempt from taxes and increase the costs to patients and public purchasers for those medicines by 12 to 18 percent. Another proposal approved by the Lower House (PEC 45/2019) would dramatically reduce the combined federal, state and municipal tax rate on medicines and exempt from taxation medicines used to treat cancer and other severe diseases. While the latter proposal is promising, proposals to eliminate taxes on certain products including medicines have previously lapsed.

- **Restrictive government pricing, reimbursement and access policies**: ANVISA's Drug Market Regulation Chamber (CMED) regulates the pricing and reimbursement of medicines in Brazil, which often creates market access barriers for PhRMA member companies and prevents timely patient access to new treatments and cures. Key challenges include delayed pricing decisions, government price ceilings on innovative medicines sold to private and public purchasers as a condition of market entry, delays in new medicine price definitions, price increases capped below inflation despite rising production costs and rigid health technology assessment (HTA) requirements by the National Committee for Technology Incorporation (CONITEC) that prevent more flexible and value-based approaches to evaluating and paying for health care. Only 37 percent of new medicines launched globally since 2012 have launched in Brazil, with patients waiting an average of 29 months from global first launch for the new medicines that become available. Further, only 12 percent of these new medicines are publicly reimbursed by the *Sistema Único de Saúde* (SUS), with patients waiting an average of 59 months from global first launch to public reimbursement by the SUS.

- **Government purchasing and Product Development Partnerships**: Brazil has developed a regulatory framework for the establishment of Product Development Partnerships (PDPs). While this framework provides improved transparency, Brazil still lacks clear rules regarding the purchasing preferences offered to PDPs. In addition, while the Ministry of Health (MoH) is tasked with reviewing and approving PDPs, it can nevertheless approve a PDP submitted by a third party for products with a valid patent in Brazil although it is restricted from purchasing that product through the third party. The Federal Audit Court (TCU) recently issued a decision instructing the Ministry of Health to suspend the initiation of new PDPs until certain

---

181 *Id.*
issues identified within the program are addressed.\textsuperscript{182} Thus, the PDP policy still lacks transparency and predictability, disincentivizing pharmaceutical investment in Brazil.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Patent Backlogs**

Patent backlogs hinder innovation and compromise the certainty and predictability necessary for the proper functioning of IP regimes. Brazil’s patent examination backlog is particularly egregious, requiring INPI 10.25 years on average to examine a biopharmaceutical patent.\textsuperscript{183} Patent offices in OECD countries (e.g., United States and Korea), China, Europe and other economies have an average patent pendency period of 2-4 years. The time is ripe for Brazil to establish a PTA mechanism to ensure that innovators are not harmed by undue delays in the patent examination process, consistent with OECD best practices and international standards.

Indeed, the need for PTA is even more acute given the Brazilian Supreme Court’s 2021 decision eliminating the sole paragraph of Article 40 of the Patent Law, which ensured a minimum patent term of 10 years from the date of patent grant in Brazil, leaving patent applicants across all technology sectors without a recognized mechanism to be compensated for unreasonable patent office examination delays. Even worse for pharmaceutical and other health-sector innovators, the Supreme Court held that the decision should be applied retroactively to their patents – eliminating overnight thousands of patents and raising discrimination concerns under Brazil’s international commitments, including the WTO TRIPS Agreement.

Countries have long recognized that patent office delays diminish the incentive that patents are designed to provide and stunt critical investment to small and medium enterprises. It is noteworthy that several OECD countries – such as Chile, South Korea and the United States – have implemented PTA mechanisms to restore a portion of the patent term for unreasonable delays during examination of a patent application. Brazil should seize the opportunity, including through the work of GIPI, to provide PTA and align its IP regime with OECD best practices.

Lack of Regulatory Data Protection

Brazilian law (Law 10.603/02) provides data protection for veterinary, fertilizer and agrochemical products, but still does not provide similar protection for pharmaceutical products for human use, resulting in discriminatory treatment. Contrary to TRIPS Article 39.3, Brazil continues to allow government officials to grant marketing approval for pharmaceuticals to competitors relying on test and other data submitted by innovators to prove the safety and efficacy of their products. Additional efforts are needed to provide certainty that test and other data will be fully protected against unauthorized use to secure marketing approval for a fixed period of time.

PhRMA members continue to seek protection for their data through the judicial system. Although there have been lawsuits seeking to secure a period of data protection for specific products, those cases are still pending in the Brazilian courts, leaving innovators without reliable RDP.

Compulsory Licensing

The compulsory licensing mechanisms being championed by some in the National Congress undermine Brazil’s efforts to empower innovative and creative industries and to establish a robust and reliable IP framework. These mechanisms incorrectly assume that IP is a barrier to access, expand compulsory licensing on vague and ambiguous grounds, and subject all sectors to the threat of unfettered compulsory licensing.

For example, in 2021, Brazil’s National Congress, through PL No. 12/2021, sought to dramatically expand the compulsory licensing provisions outlined in the Industrial Property Law. The bill would have granted broad and sweeping powers to the Brazilian National Congress to issue compulsory licenses based on vague and ambiguous grounds (i.e., by declaring a “public health emergency”, “national or international interest”, or in instances of “public calamity”) and facilitated compulsory licenses for COVID-19 related technologies. The bill also required patent owners to share necessary trade secrets, technical information and know-how to exercise the patent subject to compulsory licensing. Patent holders who failed to provide this information, including any biological material, would have lost their patent entirely. These efforts vastly exceed the limited exception to patent rights permitted under the TRIPS Agreement. While some of the most onerous elements of the bill were vetoed, including provisions of the legislation which would have forced technology transfer (including trade secrets, technical information and know-how), granted the National Congress authority to consider and issue compulsory licenses, and facilitated compulsory licenses for COVID-19 related technologies, and the National Congress maintained the vetoes, other provisions of the bill became law, sending a troubling signal to innovators. Moreover, Senate champions continue their efforts to advance bills (e.g., Bill No. 2505/2022) that would expand compulsory licensing in Brazil, including several of the provisions vetoed by the President.
National Intellectual Property Strategy

On December 11, 2020, Brazil published its National Intellectual Property Strategy. The Strategy has the potential to be a powerful framework to address longstanding IP concerns and to proactively drive an IP policy agenda that provides innovators the necessary certainty they need to collaborate with partners, support necessary research and development investments, and accelerate the launch of new medicines.

The strategy identifies essential policies related to life sciences innovation, including patent examination and backlog procedures, RDP and others. Further initiatives such as the strengthening of the Brazilian PTO and enforcement actors are also provided for in the strategy. We urge GIPI to coordinate with stakeholders, including the innovative biopharmaceutical industry, as it works to implement its national IP strategy and to clearly define a strategy and map out actions to eliminate the patent examination backlog. A successfully implemented IP strategy should align biopharmaceutical patentability and IP enforcement criteria and procedures with international rules and best practices.

Market Access

Regressive Taxes on Medicines

Combined federal, state and municipal sales taxes account for 31 percent of the cost of medicines in Brazil, one of the highest tax burdens on medicines in the world compared to the global average of 6 percent.184 Currently, there are competing tax reform proposals in the National Congress impacting the biopharmaceutical sector. One proposal from the Executive branch and approved by the Lower House (bill 2337/2021) would impose new taxes on approximately 18,000 medicines that are currently exempt from taxes and increase costs to patients and public purchasers for those medicines by 12 to 18 percent. Another proposal approved by the Lower House (PEC 45/2019) would dramatically reduce the combined federal, state, and municipal tax rate on medicines and exempt from taxation medicines used to treat cancer and other severe diseases. PhRMA and its member companies continue to support reform proposals under consideration by Brazil’s Congress to reduce or eliminate taxes on medicines. While the latter proposal is promising, proposals to eliminate taxes on certain products including medicines have previously lapsed.

High tariffs and taxes can prevent access to new treatments for patients that need them. Under the WTO Pharmaceutical Agreement, 34 countries agreed to eliminate import duties on a wide range of medicines and other health products. However, the majority of Latin American economies, including Brazil, are not parties to the WTO Pharmaceutical Agreement. Between 2006 and 2013, the value of worldwide biopharmaceutical trade in countries that are not parties to that Agreement increased at a compound annual growth rate of more than 20 percent. This means that a larger

proportion of medicines distributed around the world are potentially subject to tariffs. To help remedy this trend, Brazil should accede to the WTO Pharmaceutical Agreement. However, the majority of Latin American economies, including Brazil, are not parties to the WTO Pharmaceutical Agreement. Between 2006 and 2013, the value of worldwide biopharmaceutical trade in countries that are not parties to that Agreement increased at a compound annual growth rate of more than 20 percent. This means that a larger proportion of medicines distributed around the world are potentially subject to tariffs. To help remedy this trend, Brazil should accede to the WTO Pharmaceutical Agreement.

Restrictive Government Pricing, Reimbursement and Access Policies

ANVISA’s CMED regulates the pricing and reimbursement of medicines in Brazil, which often creates market access barriers for PhRMA member companies and prevents timely patient access to new treatments and cures. Key challenges include government price ceilings on innovative medicines sold to private and public purchasers as a condition of market entry, delays in new medicine price definitions, price increases capped below inflation despite rising production costs and rigid HTA requirements, including new cost-effectiveness thresholds, by CONITEC that prevent more flexible and value-based approaches to evaluating and paying for health care. Although new medicines are supposed to be available for patients within 180 days from the filing of a successful application, CONITEC assessments may take up to 9 months for a final decision, and the overall pricing and reimbursement process typically takes significantly longer. Only 37 percent of new medicines launched globally since 2012 have launched in Brazil, with Brazilian patients waiting an average of 29 months from global first launch for the medicines that become available. Further, only 12 percent of these new medicines are publicly reimbursed by the SUS, with patients waiting an average of 59 months from global first launch to public reimbursement by the SUS.

Government Purchasing and PDPs

The Brazilian Government issued Federal Law 12.349/10 in 2010, granting preferences for locally manufactured products and services in public tenders. A price preference of up to 25 percent is automatically applied to locally produced medicines in government tenders. An amendment to Portaria MDIC 279/11 provided a list of pharmaceutical products eligible for preference margins and defined the parameters for its application in public purchases. While the issuance of Portaria MDIC 279/11 brought more transparency to the purchase process, it still does not adequately define the compensation to be offered by those companies that benefit from this mechanism.

185 Id.
188 Id.
Meanwhile, a new PDP regulation (Portaria 2531/14, subsequently referenced in Consolidation Ordinance no. 5 in 2017) was issued in 2014 with participation of the private sector, which was intended to provide greater transparency and predictability. Since then, the Brazilian Government has announced several PDPs under the new regulation. It remains unclear what criteria were evaluated in assessing and approving these PDPs and the purchasing preferences that will be extended to an approved PDP. In addition, the MoH does not consider or assess relevant IP rights of products that are the object of a PDP application. As a result, the MoH has approved several third-party PDP applications for innovative and patent protected products.

Recognizing these shortcomings, Brazil conducted a public consultation in 2018 toward revising PDP requirements. In 2019, the MoH held a public consultation with industry to discuss updates to the PDP framework that seek to redefine eligibility criteria and update submission procedures and protocols for governance and monitoring. Further, in July 2019, 19 PDP agreements were unexpectedly put into various phases of suspension for a wide range of reasons. Products included medicines to treat hepatitis C, autoimmune conditions and vaccines.

In 2023, the new Minister of Health expressed Brazil’s aspirations to increase local production of strategic health inputs to 70 percent of national needs, suggesting that more PDPs will be developed in the coming years. In September, the Federal Government launched the National Strategy for the Development of the Health Economic-Industrial Complex, updating the PDP legal framework with the goal of increasing the stability of the policy. However, the TCU recently instructed the Ministry of Health to suspend the initiation of new PDPs until certain issues identified with the program are addressed. These issues include the absence of clear, objective criteria for determining the list of medications eligible for PDP proposals, legal uncertainties surrounding the selection of public partners and the lack of objective criteria for evaluating PDP proposals submitted by both public and private partners. As a result, the PDP policy remains opaque and unpredictable.

PhRMA and its member companies operating in Canada are extremely concerned about Canada’s market access environment and intellectual property (IP) protections for patented medicines. Of particular concern is Canada’s intention to reform pricing policies for patented products that would significantly undermine the practical benefits to U.S. companies of Canada’s trade-related intellectual property commitments and create uncertainty for patients. In addition, Canada’s IP regime continues to lag that of other developed nations in several respects.

**Key Issues of Concern:**

- **The Patented Medicine Prices Review Board (PMPRB):** On July 1, 2022, amendments to the Patented Medicines Regulations (“Amended PMR”) governing the PMPRB came into force. The amendments included arbitrary changes to the PMPRB’s basket of reference countries to cut the prices of patented biopharmaceutical products. In September 2023, the PMPRB finalized an interim Guidance which was adopted without modification following stakeholder consultation.\(^{190}\) The PMPRB has indicated that there will be two rounds of subsequent consultation on a final guidelines – a first phase coming in late 2023 to build an active dialogue with stakeholders, followed by a second round of consultations focusing on the development of new guidelines in 2024.\(^ {191}\) PhRMA and its member companies remain very concerned that the next iteration of proposed PMPRB Guidelines could significantly undermine the marketplace for innovative pharmaceutical products by undervaluing and discouraging medical advances, delaying or preventing the introduction of new medicines in Canada due to a suboptimal pricing environment, and reducing investments in Canada’s life sciences sector where free-market pricing is not upheld.

- **Patient access delays due to protracted health technology assessments (HTAs) and public reimbursement processes:** Canada has many bureaucratic barriers that extend the time between submission to the federal government of newly discovered medicines and vaccines for regulatory approval and their availability to patients through public reimbursement plans. Only 21 percent of new medicines launched globally since 2012 are reimbursed on Canada’s public plans, compared to 85 percent in the United States.\(^ {192}\) These barriers significantly delay the benefits of new medicines and vaccines for Canadian citizens and erode the time that companies have to commercialize their innovations.

---

• **Lack of a policy and adequate incentives for drugs for rare diseases:** Unlike the United States and Europe, Canada has no established definition, dedicated regulatory pathway or specific IP incentives for drugs for rare diseases. Current HTA processes in Canada significantly undervalue these medicines, often calling for unrealistic price reductions in excess of 90 percent. In March 2023, the federal government announced an investment of 1.5 billion over three years as part of the National Strategy for Drugs for Rare Diseases, designed to increase access to rare disease medications through agreements with the provinces and territories. Funds remain unused as agreements have not been negotiated. Canada should elevate its regulatory standards and incentives to be more consistent with international best practices.

• **Weak patent enforcement:** The Canadian Patented Medicines (Notice of Compliance) Regulations (the “PM(NOC) Regulations”)\(^ {193}\) include several key deficiencies that weaken Canada’s enforcement of patents, including excessive and windfall damage awards to generic litigants, and limitations and inequitable eligibility requirements on the listing of patents in the Patent Register. Jurisprudence under the PM(NOC) Regulations has also resulted in a heightened level of liability for patent owners akin to punitive damages. PhRMA and its member companies continue to be troubled that Canada has used implementation of the Canada-EU Comprehensive Economic and Trade Agreement (CETA)\(^ {194}\) to implement reforms not required by that Agreement, which expose innovators to even greater potential liability under Section 8 of the PM(NOC) Regulations. PhRMA members continue to be concerned about potential damage awards which could stem from various common law theories within the Canadian provincial courts.

• **Inadequate patent term restoration (PTR):** Under CETA, Canada is required to provide innovators with some compensation for delays in obtaining marketing approval for pharmaceuticals. However, in its CETA implementing regulations, Canada has chosen to implement an “export” exception that is inconsistent with the fundamental purpose of restoring a portion of the patent term lost due to the marketing approval process and has only adopted the minimum term of PTR negotiated under CETA further deviating from global standards. Furthermore, Canada’s adoption of restrictive time limits and eligibility criteria will unduly and unreasonably limit patent term restoration eligibility in Canada in a manner that is contrary to the intent of the negotiation and the CETA text itself. Finally, Canada interpreted the PTR regulations required by CETA in a narrow manner that is inconsistent with the spirit, if not the text, of the treaty.\(^ {195}\) PhRMA’s member companies believe Canada should support innovation by ensuring that its PTR

---

\(^ {193}\) Patented Medicines (Notice of Compliance) Regulations, SOR/93-133.

\(^ {195}\) GlaxoSmithKline Biologicals S.A. v. The Minister of Health, 2020 FC 397.
system effectively ameliorates the effects of lengthy regulatory processes, which can significantly erode the duration of the IP rights of innovators.

- **Non-compliant patent term adjustment (PTA) system**: The USMCA also requires Canada to provide PTA for unreasonable delays during the prosecution and issuance of any patent, which Canada has not yet enacted. Proposals to implement a PTA system in Canada as required by USMCA are riddled with deficiencies from running the PTA concurrently with PTR rather than independent adjustments to imposing limits on the scope of delays that can be compensated and permitting third-party opposition to PTA applications. As passed, Canada’s PTA system will not comply with its international commitments, since it imposes significant and inequitable barriers that will prevent innovators from receiving the intended meaningful remedy for patent office delays.

- **Standard for the disclosure of confidential business information (CBI)**: In November 2014, Canada enacted legislation to update its Food and Drugs Act (Bill C-17). Provisions in that law granted the Health Minister discretion to disclose a company’s CBI without notice to the owner of the CBI and in accordance with a standard that is both inconsistent with other similar Canadian legislation and Canada’s treaty obligations. On March 20, 2019, regulations were put in place respecting these authorities to release information about therapeutic products. Further, on July 9, 2018, the Federal Court of Canada issued a decision ordering Health Canada to release vast amounts of pharmaceutical clinical trial data on five medications to a researcher, undercutting the federal government’s attempts to keep the information confidential. The decision, which was not appealed by Health Canada, has the potential to exacerbate the negative impacts of the regulations and guidelines on biopharmaceutical innovators.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Market Access**

The Patented Medicine Prices Review Board (PMPRB)

The PMPRB is a quasi-judicial body created under the Canadian Patent Act with a legislative mandate to ensure that prices of patented medicines are not “excessive.” Due to its power in shaping the real-world benefits of IP property protections, the PMPRB is an important institution within Canada’s broader IP regime for pharmaceuticals.

---

198 Doshi v. Canada (Attorney General), 2018 FC 710.
PMPRB regulates the maximum allowable price that a manufacturer can charge for all patented medicines in Canada regardless of payer. The PMPRB does not make decisions about the amount of reimbursement for a product, which is appropriately the responsibility of separate federal and provincial/territorial drug plans, or private insurers.

On August 21, 2019, Health Canada published the Amended PMR²⁰⁰ as part of the PMPRB’s professed role as a “counterweight to the patent rights of pharmaceutical manufacturers.”²⁰¹ The Amended PMR constituted an impermissibly broad exception to IP rights in contrast to Canada’s obligation under the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). The implementation of the Amended PMR²⁰² was delayed on four occasions to account for the COVID-19 pandemic and the need for further stakeholder consultation in the context of other initiatives.²⁰³ On July 1, 2022, the only lawful element of the Amended PMR upheld by the courts to date, namely, the changes to the basket of reference countries, came into force.²⁰⁴

This change remains of great concern to U.S. biopharmaceutical innovators due to the potential impact on the availability of new medicines and the competitiveness of Canada for research-based pharmaceutical investment. Canada amended the PMPRB’s basket of reference countries with the goal of setting ceiling prices of patented medicines at the OECD median. Through this amendment, the PMPRB removed the United States and Switzerland – two countries that take a more holistic view of the value of medicines – and added six jurisdictions with lower drug prices and more onerous price controls to the reference basket of countries. The reference countries now consist of Australia, Belgium, France, Germany, Italy, Japan, Netherlands, Norway, Spain, Sweden, and the United Kingdom referred to as PMPRB11. The United States is Canada’s largest trading partner and the pharmaceutical markets in both countries share many common features, including important supply chains for the pharmaceutical industry. While PhRMA and its member companies believe that international reference pricing is a deeply flawed methodology that undermines continued R&D in medicines that patients need most, it is particularly egregious for Canada not to reference the United States and other countries with pro-innovation biopharmaceutical policies.

²⁰⁴ While the Federal Court of Appeal upheld the collection of international pricing information, it has clearly stated that if the Board later uses the comparative information to set or control prices then it has exceeded its jurisdiction. See Innovative Meds Can. v. Can. (Attorney General, 2022 FCA 210, available at https://decisions.fca-caf.gc.ca/fca-caf/decisions/en/item/521063/index.do (last visited Oct. 21, 2023).
In addition to the Amended PMR, the PMPRB has undergone other setbacks in implementing Guidelines to supplement the regulatory framework. The PMPRB previously developed several draft iterations of the Guidelines that were each of significant concern to the innovative biopharmaceutical industry because of the PMPRB’s insistence on setting the ceiling prices for medicines at the median price in the new reference basket of countries, contrary to the PMPRB’s mandate to ensure that prices are not excessive. In September 2023, the PMPRB finalized an interim Guidance which was adopted without modification following stakeholder consultation. Concerningly, the PMPRB continues to identify specific price points that are “below the median,” which is inconsistent with the PMPRB’s excessive price standard. More recently, the PMPRB indicated that there will be two rounds of consultation for the final guidelines – a first phase coming in late 2023 to build an active dialogue with stakeholders, followed by a second round of consultations focusing on the development of new guidelines in 2024.

In the thirty years since the PMPRB was established, a variety of mechanisms have emerged in Canada for the government and industry to work together to ensure the affordability of medicines. The specific change to include a cost-effectiveness factor as part of PMPRB’s price evaluation overlaps with and duplicates the work of existing publicly funded agencies (e.g., pCPA), and its major beneficiary would be for-profit private insurers as opposed to patients. Any expansion of the PMPRB’s mandate is therefore unnecessary and would harm U.S. innovative biopharmaceutical companies and the patients they serve.

---

207 For example, these mechanisms include the Canadian Agency for Drugs and Technologies in Health (CADTH) Reimbursement Reviews, the Institut national d’excellence en santé et services sociaux (INESSS) in Quebec, the pan-Canadian Pharmaceutical Alliance (pCPA) and confidential Product Listing Agreements (PLAs) directly with public and private payors, among others.

208 As it is, PMPRB is already taking decisions that exceed its statutory mandate. On July 29, 2021, the Federal Court of Appeal ruled against a decision of the PMPRB requiring that the price of Alexion’s Soliris® be lower than that in the Board’s seven comparator countries. See Alexion Pharms Inc. v. Can. (Attorney General), 2021 FCA 157, available at https://decisions.fca-caf.gc.ca/fca-caf/decisions/en/item/500849/index.do?q=alexion (last visited Oct. 21, 2023). The Federal Court of Appeal held forcefully that the Board’s decision went beyond its statutory mandate, engaging in the regulation of what it viewed to be reasonable prices for medicines, rather than its proper mandate of determining whether a medicine’s price is “excessive”, i.e., an abuse of the innovator’s patent rights. While the federal government sought leave to appeal to the Supreme Court of Canada, that application was dismissed.
Patented medicines accounted for only 6.5 percent of Canadian health care spending in 2019 and have not grown in real terms over the last decade. This data suggests that patented medicines are not the primary cost driver of health care spending, which calls into question whether the regulatory changes will generate benefits that outweigh the potential risks to access and innovation. Low prices should not be the only goal of pharmaceutical policy and we urge the government to carefully consider the impact of pricing policies on access to new medicines, clinical studies, launch of new treatments, investment, jobs and the research ecosystem as a whole.

PhRMA requests that the U.S. Government urge the Canadian Government to reconsider any changes to the PMPRB’s mandate that would harm U.S. innovative biopharmaceutical companies and undermine the competitiveness of Canada’s life sciences sector. The PMPRB’s role must be placed in its proper context with the many other agencies already active in the Canadian pharmaceutical marketplace and should not be a means to unreasonably prejudice the legitimate interests of a patent owner, consistent with Canada’s international obligations to protect patents.

The PMPRB is also required to report to the Federal Minister of Health on pharmaceutical trends and on R&D spending by pharmaceutical patentees. Due to the antiquated 1987 tax law formula used to measure R&D spending, which is referenced in its governing regulations, PMPRB has consistently and systematically under-reported the R&D levels of innovative pharmaceutical companies operating in Canada for many years, underestimating the industry’s contribution to private sector R&D spending and lessening the government’s willingness to address the myriad issues described above. To the extent that the PMPRB should have a mandate to report on R&D spending in Canada, PhRMA members urge the U.S. Government to encourage Innovation, Science and Economic Development Canada to engage with industry as it assesses how to update the regulatory R&D definition so that the PMPRB can more accurately calculate the significant R&D contributions made by pharmaceutical patentees to the Canadian knowledge-based economy.

**Patient Access Delays Due to Protracted Health Technology Assessments and Public Reimbursement Processes**

Beyond the regulatory approval for safety and efficacy, there are additional market access barriers that significantly delay Canadian patients’ ability to access new medicines and vaccines. Obtaining market authorization is only the first hurdle in launching a pharmaceutical product in the Canadian market. Once the regulator determines that a product is safe and effective, it is subsequently reviewed by an HTA body (of which there are two in Canada, INESSS(Quebec), CADTH (rest of Canada), which informs the negotiations led by the pan-Canadian Pharmaceutical Alliance (pCPA). Following pCPA

---

210 Id.
negotiations, interested public payers enter into a common agreement known as a Letter of Intent (LOI) with manufacturers detailing the preliminary terms and conditions for public reimbursement. Following the LOI, manufacturers must then negotiate with each individual jurisdiction to finalize PLAs to ultimately list a drug on a public formulary. These processes have become increasingly time-consuming and complex in nature, and on average it takes 22 months to complete, which is double the amount of time it takes in most other OECD countries. During that time period, patients are unable to access these medicines and patentees are unable to fully benefit from market exclusivity and the rights and benefits associated with their patents are eroded as a result.

Eighty-five percent of new medicines launched globally since 2012 have launched and are publicly reimbursed in the United States compared to just 21 percent available on Canadian public drug plans, with Canadian public plan patients waiting an average of 52 months from global first launch to reimbursement for the new medicines that do become available.211

Overall, these barriers significantly delay the benefits of new medicines and vaccines for Canadian citizens and erode the already limited time for innovative companies to commercialize their significant investments in R&D, clinical trials and regulatory approval processes. Fewer clinical trials also means less access for patient to potentially innovative treatments. PhRMA and its member companies urge the U.S. Government to engage with the Canadian Government on these growing delays that are hindering patient access to new medicines.

Lack of a policy and adequate incentives for drugs for rare diseases

Unlike the United States and Europe, Canada has no established definition, dedicated regulatory pathway or specific IP incentives for drugs for rare diseases. Without a dedicated rare disease regulatory pathway, delays in access are common for patients living with rare disease, with disparities in access between provinces and territories. Existing clinical trial and HTA processes are ill-equipped to assess value and manage uncertainty at the time of rare disease product launch. Current HTA processes significantly undervalue these medicines, often calling for unrealistic price reductions in excess of 90 percent. In March 2023, the federal government announced a total investment of up to $1.5 billion over three years in support of the first-ever National Strategy for Drugs for Rare Diseases to help increase access to, and affordability of, promising and effective drugs for rare diseases. Of this funding, 1.4 billion will be available to provinces and territories to cover a small set of new and emerging drugs that will be covered in a consistent way across the provinces and territories. This funding remains unused as no agreements have been reached. Canada should elevate its regulatory standards and incentives to be more consistent with international best practices, and also work toward reducing disparities in access to these medications across the provinces and territories.

Intellectual Property Protection

Weak Patent Enforcement

In 1993, the PM(NOC) Regulations were promulgated for the stated purpose of preventing the infringement of patents by the premature market entry of generic drugs as a result of the “early working” exception. In 2015, the Canadian Government helped resolve significant difficulties related to inappropriate court decisions that prevented the listing of patents relevant to combination inventions, which seriously undermined patent enforcement actions relevant to those inventions. However, serious and systemic deficiencies remain with the PM(NOC) Regulations. The regulations do not reliably provide “expeditious remedies to prevent infringements and remedies which constitute a deterrent to further infringements,” as required under USMCA and the TRIPS Agreement. For example:

1. Proceedings under the PM(NOC) Regulations and appeal rights

   The negotiated CETA text stipulates that “patent linkage” systems must provide all litigants with “equivalent and effective rights of appeal.” The intention behind this negotiated outcome was to address the asymmetry in legal rights that flowed from Canada’s previous restrictive PM(NOC) Regulations regime under which a patent owner did not have an equal return on assets (ROA) as that afforded to a generic drug producer. CETA simply required Canada to correct this imbalance. The changes to the PM(NOC) Regulations, however, have proven to be far more extensive than necessary to comply with Canada’s CETA obligations in a manner that prejudices existing innovator rights.

   For example, despite adopting significantly more procedural complexity under the new regime, including full pleadings, discovery and trials in order to make final patent determinations in a single proceeding, Canada has maintained the same 24-month statutory stay that governed the old summary system. As a result, the innovative industry is concerned that patentees will now be forced to choose between the surrender of procedural rights and obtaining meaningful injunctive relief under the new regime, contrary to Canada’s many other related international obligations to protect intellectual property rights.

2. Limitation on Listing of Valid Patents and Inequitable Listing Requirements

   Patent owners continue to be prevented from listing their patents on the Patent Register established under the PM(NOC) Regulations if the patents do not meet certain arbitrary timing requirements that are not present in the United States under the Hatch-Waxman Act. The effect of these rules is to deny innovative pharmaceutical companies access to enforcement procedures in the context of early working for any patent not meeting these arbitrary listing requirements.

In addition, the PM(NOC) Regulations may only apply to patented products that are marketed in Canada, despite being approved by the health authority and having an assigned drug identification number. This is contrary to Canada’s obligations under USMCA, which require effective patent enforcement for all “approved” drugs.

3. Excessive Level of Liability for Lost Generic Profits

The PM(NOC) Regulations allow an innovator to seek an order preventing a generic manufacturer from obtaining a Notice of Compliance, on the basis that the innovator’s patent covers the product and is valid. When the innovator seeks such an order, but is ultimately unsuccessful, Section 8 provides the generic manufacturer the right to claim damages in the form of lost profits for the period of time they could have been selling the product, but for the innovator’s action. As such, Section 8 unreasonably prejudices the legitimate interests of the patent owner. One legitimate right of a patent owner is to petition the government to enforce a patent which that government granted in the first place. Unless the patent owner has obtained its patent by fraud or otherwise knows that the patent is invalid or uninfringed, any grievance or damages claim by a generic manufacturer in connection with a patent that is later found invalid or uninfringed should not result in punishment of a patent owner for relying in good faith on a patent duly issued by the Canadian Intellectual Property Office (CIPO).

PhRMA members are also concerned that Canadian courts have taken an approach to Section 8 damages that allows for excessive damages. Subsection 8(1) compensates for all losses actually suffered in the period during which the second person/company was held off the market – a provision that, as currently interpreted by the courts, has led to instances of overcompensation. The Courts have granted damages in excess of 100 percent of the total generic market, despite holdings that the provision is meant to be compensatory and not punitive in nature. Such overcompensation is contrary to the law of damages and reflects a punitive as opposed to a compensatory theory of damages.214, 215

214 The Supreme Court of Canada granted leave with respect to a Section 8 damages case, but in April 2015 dismissed this case from the bench, stating that it did so substantially for the reasons of the majority in the Federal Court of Appeal. Sanofi-Aventis, et al. v. Apotex Inc., et al., SCC. 35886, available at http://www.scc-csc.gc.ca/cas-dossier/info/dock-regi-eng.aspx?cas=35886 (last visited Oct. 21, 2023). The dismissal of the appeal provided parties to Section 8 damages litigation with no meaningful higher court guidance with respect to how these damages are to be calculated in future lower court decisions, which means any clarity must come from regulatory amendments by the Government of Canada.

215 On April 23, 2018, Eli Lilly Canada (Lilly) applied to the Supreme Court of Canada for leave to appeal in respect of a March 2018 decision of the Federal Court of Appeal. The Federal Court of Appeal had dismissed Lilly’s appeal of a trial decision awarding more than $70 million to Teva Canada (Teva) under Section 8. The Federal Court of Appeal granted Teva’s cross-appeal seeking to add to its recovery lost sales and an adjustment to account for an under-reporting of sales in the data relied on by both parties’ experts. Eli Lilly Can. Inc. v Teva Can. Ltd., 2018 FCA 53, available at https://decisions.fct-cf.gc.ca/fca-ca/decisions/en/307557/1/document.do (last visited Oct. 21, 2023). Lilly was denied leave by the Supreme Court of Canada on November 8, 2018.
The amended PM(NOC) Regulations established new rules that further expose innovators to excessive liability under Section 8. The Regulations eliminate previous language specifying that the period during which the innovator is liable to the competitor for any losses suffered ends on the date the stay is withdrawn or discontinued by the innovator or is dismissed or reversed by the court. This unwarranted change is likely to result in excessive damages awards by enabling competitors to claim indefinite future losses and to seek compensation for production “ramp-up” costs they may have incurred before the stay was granted and after it was lifted. In addition, innovators are now “jointly and severally” liable for any damages. Expanding the scope of liability in this manner will enable competitors to claim damages from local subsidiaries or licensees, as well as their licensors or corporate partners in the United States.

Also, in the area of excessive damage liability, PhRMA members are concerned about ongoing litigation under various common law theories within the provincial courts. In spite of Canadian PM(NOC) Regulations governing compensatory damages for generic companies held off the market due to patent litigation, other proceedings have been allowed to proceed under various common law theories (Statute of Monopolies, Trademarks Act, unjust enrichment and others). These cases could result in damages or liability for PhRMA members which exceed the compensatory threshold.

Therefore, PhRMA members request that the U.S. Government urge Canada to implement amendments to the PM(NOC) Regulations to address this issue.

Inadequate Patent Term Restoration

PTR seeks to compensate for a portion of the crucial effective patent life lost due to clinical trials and the regulatory approval process. Most of Canada’s major trading partners, including the United States, the European Union and Japan, offer forms of PTR which generally allow patent holders to recoup a valuable portion of a patent term where time spent in clinical development and the regulatory approval process has kept the patentee off the market. In these countries, up to five years of lost time can be recouped.

By way of implementing CETA, Canada had an opportunity to make a significant step to provide innovators with some compensation for delays in obtaining marketing approval for pharmaceuticals. Under CETA, Canada agreed to implement a “sui generis protection” period of between 2 to 5 years for pharmaceuticals to compensate for delays in drug marketing approval, subject to certain specified conditions.

However, PhRMA has concerns with Canada’s implementation of this commitment under the Certificate of Supplemental Protection (CSP) Regulations. At a fundamental level, the sui generis protection provided by the CSP does not appear to grant the full patent protections that PTR is intended to provide and instead appears to be implemented subject to an exception for “manufacture for export.” While this is permitted by the CETA text, this is not consistent with Article 20.46 of the U.S.-Mexico-Canada Agreement.

---

Implementing PTR so that it does not confer full patent rights, e.g., providing an exception for “manufacturing for export” or other infringing activities, is not consistent with the fundamental purpose of restoring patent term lost due to the lengthy marketing approval process.

Moreover, having only adopted the minimum term of PTR negotiated under CETA (i.e., Canada’s term is capped at two years of a possible five), Canada’s further adoption of restrictive time limits and eligibility criteria will unduly and unreasonably limit CSP eligibility in Canada in a manner that is contrary to the intent of the negotiation and the CETA text itself.

In particular, the CSP Regulations introduce a new and complex CSP application requirement whereby only those Canadian new drug submissions (NDSs) filed within 1 year of any first international drug submission filed for the same drug (in any of the EU, UK, U.S., Australia, Switzerland or Japan) will be CSP eligible (the “Timely Submission Requirement”). The Timely Submission Requirement is a novel requirement in Canada that is unprecedented amongst the PTR regimes of Canada’s major trading partners, including the United States. PhRMA is concerned that the 1-year time limit being enforced under the Timely Submission Requirement will inappropriately bar otherwise deserving and eligible innovative medicines from benefiting from the period of sui generis protection.

Moreover, unlike other jurisdictions, Canada has further implemented a list of “variations” of medicinal ingredients and other prior drug approvals that will automatically exclude new drug submissions from possible CSP eligibility. Neither the U.S. nor EU patent term extension regimes provide enumerated lists of excluded variations ineligible for CSP.

Finally, Canada is interpreting the CSP Regulations in a manner that is inconsistent with the intent of CETA and in a way that disregards clear clinical evidence. In the first judicial review decision under the CSP Regulations, the Federal Court reinforced Canada’s requirement to comply with the rationale, purview and specific

---

constraints of the statutory scheme and any relevant international law, including CETA.\textsuperscript{218} However, the Federal Court’s decision was overturned on appeal.\textsuperscript{219}

We urge the U.S. Government to engage with the Canadian Government on this issue in all available fora and encourage Canada to join the ranks of other industrialized countries who are champions of IP protection internationally and to provide for effective and competitive PTR measures in Canada. CSP eligibility should not be circumscribed by overly restrictive enumerated exclusions on medicinal ingredients and patents.

**Non-Compliant Patent Term Adjustment (PTA) System**

Under USMCA, Canada is required to implement a patent term adjustment (PTA) system to compensate patentees for “unreasonable” delays in the patent examination process by January 1, 2025. On June 22, 2023, the Canadian government passed a budget bill which included amendments to the Patent Act to implement a PTA system.\textsuperscript{220} The legislation will come into force at a later date and related regulations are currently being developed. As passed, Canada’s PTA system will not comply with its international commitments, since it imposes significant and inequitable barriers that will prevent innovators from receiving the intended meaningful remedy for patent office delays.

Under Canada’s system, PTA terms will run concurrently with Certificate of Supplementary Protection (CSP) terms, which is a separate and distinct benefit provided to pharmaceutical patentees due to the lengthy development and regulatory approval process. In practice, running PTA and CSP terms concurrently will result in the term of one vitiating the other term, and patentees will not receive the full benefit to which they are entitled. If Canada proceeds with this approach, it will fail to fulfill two independent trade obligations, which each serve important purposes and compensate for distinct delays.

\textsuperscript{218} On April 7, 2020, the Federal Court issued its first judicial review decision under the CSP Regulations. The Court held that the Minister’s decision to deny a CSP for the drug Shingrix\textsuperscript{®} was unreasonable. While the Minister was ordered to redetermine the matter on the merits, the Minister is appealing the court’s decision. The parties disagree on whether a particular vaccine adjuvant is a medicinal ingredient for the purpose of applying the CSP Regulations. Protecting vaccine adjuvants as “medicinal ingredients” promotes innovation and is consistent with the object of CETA. In determining that the Minister’s decision was unreasonable, the Federal Court held that Minister’s rationale demonstrated “administrative tunnel vision” and failed to address “highly relevant considerations.” GlaxoSmithKline Biologicals S.A. v. The Minister of Health, 2020 FC 397, available at https://decisions.fct-cf.gc.ca/fc-cf/decisions/en/item/468729/index.do?q=shingrix (last visited Oct. 21, 2023).

\textsuperscript{219} On April 14, 2021, the Federal Court of Appeal issued its decision allowing the appeal in favor of the Minister of Health. The Court held that, while there was more than one reasonable interpretation of the legislation, the Minister’s reading was a reasonable one. With respect to CETA, the Court found that Canada had only agreed to provide protection in a “very specific and limited way of doing so”. The Minister of Health v GlaxoSmithKline Biologicals S.A., 2021 FCA 71, available at https://decisions.fca-caf.gc.ca/fca-caf/decisions/en/item/495570/index.do (last visited Oct. 21, 2023).

The process of obtaining PTA is also rife with barriers that would render PTA unattainable for most patents and prevent patentees from receiving the intended meaningful remedy. Recently, the Canadian government proposed a number of “example” actions and periods of time that may lead to days being subtracted in the determination of additional term, including delays which are not attributable to, and in many circumstances cannot be avoided by the innovator applicant.221

In addition to the proposed deductions, the Commissioner of Patents (the Commissioner) would also have residual discretion to further subtract unspecified days from the PTA calculation. Enabling the Commissioner to consider ambiguous, unknown factors would make it extremely challenging for patentees to determine whether it is feasible to obtain additional term, and therefore assess whether it is worth undertaking the administrative burden to apply and pay the prescribed fee.

To further complicate the application process, the Canadian government also proposes to permit third party observations at the initial PTA determination stage, which would transform what should be a remedial administrative application into an adversarial process. Allowing third party observations would increase the time, cost and uncertainty in the process, and is unnecessary since third parties have other avenues to challenge any PTA term.

If PTA is granted, Canada has implemented a redetermination process that is wholly inequitable. Concerningly, there is no opportunity for patentees to seek redetermination if they believe additional PTA is owed, unless they initiate costly judicial review litigation. Calculation issues may occur, particularly in light of the proposed periods of time that may be deducted from any additional term, as noted above. As currently legislated, the Commissioner can only shorten the duration of the PTA provided or dismiss the application for redetermination. The Commissioner may reconsider the PTA term at any time, and third parties may challenge the PTA term through the Commissioner or Federal Court.

PhRMA and its member companies are highly concerned with Canada’s approach to implementing a PTA system. For the reasons set out above, Canada’s framework would not provide a meaningful remedy to patentees who are impacted by unreasonable patent office delays. We urge the U.S. government to work with the Canadian

---

221 See CIPO, “Consultation Scene Setter – Additional Term and Miscellaneous Amendments to the Patent Rules”, 2023, available at https://ised-isde.canada.ca/site/canadian-intellectual-property-office/en/consultation-amendments-patent-rules/consultation-scene-setter-additional-term-and-miscellaneous-amendments-patent-rules (last visited Oct. 21, 2023). For example, the proposed rules do not provide a reasonable period of time for an applicant to respond to CIPO communications and requisitions. As written, the deduction of days will begin immediately once a notice requiring applicant action is issued. Deducting this time period may particularly prejudice foreign or larger applicants where CIPO notices must be relayed through multiple parties, such as global head offices, and local or international counsel. Other concerning subtractions include delays caused by error on the part of the Commissioner, the period of time following a Request for Continued Examination (a regulatory requirement), and days taken to respond (or not) to communications from the Canadian Intellectual Property Office precipitated by communications from unauthorized persons.
Government to align its approach with that of the U.S. in order to ensure that Canada complies with its trade treaty obligations.

**Standard for the Disclosure of Confidential Business Information**

PhRMA members are concerned with amendments to the Food and Drugs Act, which could allow for an unprecedented disclosure of CBI contained in clinical trial and other data submitted by pharmaceutical companies in the course of seeking regulatory approval for medicines. The amendments could significantly impact incentives for drug innovation and are inconsistent with Canada’s international treaty obligations.

There is particular concern surrounding issues of confidentiality, the broad definition of CBI (broad enough to also cover trade secrets) and the threshold for the disclosure of CBI by Health Canada to governments and officials, as well as to the public. These amendments are inconsistent with the standards set out in other Canadian federal health and safety legislation, including similar provisions in more recent federal legislation, are inconsistent with Canada’s treaty obligations under USMCA and TRIPS, as well as the standards and practices of other national health regulators, including the U.S. Food and Drug Administration.

Both USMCA and the TRIPS Agreement require that CBI be protected against disclosure except where necessary to protect the public. For disclosure to the public, the amendments require a “serious risk,” but it does not reach the standard set out in the treaty language since subjective and discretionary language has been included: the Minister may disclose CBI “if the Minister believes that the product may present a serious risk of injury to human health.” (Emphasis added.) In other words, it is not necessary that there be a serious risk of injury to justify the disclosure; rather the amendments merely require that the Minister believes the disclosure to be necessary.

The amendments also state that the Minister may disclose CBI to a person who “carries out functions relating to the protection or promotion of human health or safety of the public” and this can be done “if the purpose of the disclosure is related to the protection or promotion of health or safety of the public.” There is no necessity requirement for the disclosure to occur, only that it be related to protecting or promoting health. USMCA and TRIPS do not refer to disclosure for the promotion of health, but rather to disclosure needed to protect the health of the public.

Finally, the amendments provide inadequate protections to ensure that there is no unfair commercial use of the disclosed CBI as required by TRIPS Article 39.3. The potential recipients of the disclosed CBI are very broad and there is no mechanism, such as a confidentiality agreement, to ensure that those recipients (or anyone else to whom

---

they disclose that data) are not able to use the divulged CBI to secure an unfair commercial advantage.

In July 2015, a final guidance document was issued by Health Canada with respect to the administration of its powers to require and disclose CBI.224 This guidance document was later updated and more recently in June 2021 to include the medical devices regulations.225 PhRMA and its member companies were pleased that the document provides some reassurances with respect to the administration of Health Canada’s new powers under the amended Food and Drugs Act. However, the document is a non-binding guidance as opposed to binding law or regulations.

In September 2015, a pharmaceutical company was subjected to a disclosure by Health Canada of CBI related to its pharmaceutical product, representing the first known usage of the new legislative disclosure powers. Following a request made under the new mechanisms in the Food and Drugs Act, approximately 35,000 pages of raw trial data were released, demonstrating the potential prejudice to U.S. innovative biopharmaceutical companies that could result from future CBI disclosures.226

In December 2017, Health Canada released a draft regulatory package that would amend the Food and Drug Regulations (Regulations) and facilitate automatic public access to manufacturer submitted clinical information following the issuance of a final Health Canada regulatory decision.227 As previously noted, those Regulations were published on March 20, 2019.

The Regulations specify the scope of clinical information in drug submissions that cease to be CBI following the issuance of a final regulatory decision (Notice of Compliance, Notices of Non-Compliance – Withdrawal, or Notice of Deficiency – Withdrawal). The amendments authorize the Minister to release information that has ceased to be CBI to the public without notifying or receiving consent from the originator. Clinical information provided in drug submissions would continue to be treated as

---

confidential during the regulatory review process. In addition, the Regulations apply to drugs for human use and medical devices and apply to clinical information in drug submissions filed with Health Canada both before and after the coming into force of the Regulations. The Regulations establish a mechanism to release previously submitted information, even from years or decades prior, within the scope of public disclosure.

Further complicating matters, on July 9, 2018, the Federal Court of Canada issued a decision ordering Health Canada to release vast amounts of pharmaceutical clinical trial data on five medications, undercutting the federal government’s attempts to keep the information confidential. The effect of this decision, which Health Canada chose not to appeal, on the Regulations and/or the guidelines document is unknown at present, but it presents the risk that the scope of clinical information susceptible to public release will be made even broader than under the current regulatory and guidance document proposals.

PhRMA members therefore urge the U.S. Government to press the Canadian Government to ensure that regulations to implement these amendments to the Food and Drugs Act are consistent with Canada’s international treaty obligations.
CHILE

PhRMA and its member companies operating in Chile remain concerned about past actions by the National Congress encouraging Chile’s Government to issue compulsory licenses (CLs) for certain innovative medicines, as well as proposing government price controls for which few details were provided. These developments add to longstanding intellectual property (IP) problems, including Chile’s failure to fully implement its patent enforcement and regulatory data protection (RDP) obligations under the U.S.-Chile Free Trade Agreement.

Key Issues of Concern:

- **Compulsory licensing**: In 2020, Chilean legislators supported resolutions which, while nonbinding, called for or implicated compulsory licensing mechanisms related to COVID-19 technologies. Further, public pressure is building to compel the Ministry of Health to consider compulsory licensing of innovative COVID-19 treatments. Moreover, some provisions of the “Medicines II” bill have already been negotiated by legislators and approved by the Conference Committee, including articles on compulsory licensing. These Articles establish extremely vague and ambiguous grounds for the government and third parties to seek compulsory licenses in Chile.

- **Weak patent enforcement**: PhRMA member companies believe that the Chilean Government’s draft legislative and regulatory proposals would, if approved by the Chilean National Congress and implemented, represent a step toward compliance with Chile’s treaty obligations. Unfortunately, this legislation, introduced in 2012, continues to be unlikely to move forward in the near term.

- **Inadequate patent term adjustment and restoration**: Despite having a patent term adjustment (PTA) mechanism in place, patent applicants are not being adequately compensated for INAPI delays, due to arbitrary interpretations by the TDPI (Industrial Property Court) of what constitutes an unjustified delay during the patent prosecution process. Similarly, TDPI has adopted a very high standard for patent term restoration (PTR), finding that many delays incurred by the Institute of National Health are not “unjustified administrative delays.”

- **Proposed trademark limitations**: As part of the “Medicines II” bill, Chile’s Congress is currently considering provisions to significantly limit the use of trademarks in all pharmaceutical products packaging. That bill also makes the use of the International Non-Proprietary Name (INN) mandatory in drug prescriptions and restricts the ability of doctors to prescribe a medicine using its corresponding trademark.

- **Regulatory data protection**: The Chilean Government’s enactment in December 2010 of Supreme Decree 107 corrected some deficiencies in Chile’s existing system for protecting proprietary pharmaceutical test data. However, significant
practical and legal hurdles continue to deny innovators appropriate regulatory data protection (RDP).

- **Government price controls**: With the pending finalization of the Medicines II bill, the Conference Committee in the Chilean National Congress is reviewing price regulation proposals that would grant new powers to the Chilean government to use international reference pricing to regulate the price of patented medicines in the market. Unfortunately, these proposals do not address the underlying reasons why patients in Chile face high out-of-pocket costs for medicines, including insufficient health care coverage and markups in the supply chain. Industry stakeholders largely have been excluded from consultations regarding these proposals.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Compulsory Licensing**

The Medicines II bill is still pending in the Chilean Congress. The Conference Committee has approved an article which enables the issuance of compulsory licenses on vague and ambiguous grounds, such as “inaccessibility.” PhRMA and its member companies are concerned about possible adoption and implementation of that article in a manner which would be inconsistent with international best practices and key provisions of the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). Specifically, once the Medicines II bill is finalized, relevant agencies will need to adopt corresponding implementing regulations reflecting the new law. We urge Chile to implement provisions of the finalized Medicines II bill in a manner consistent with its international obligations.

Moreover, a number of Congressional resolutions were passed in 2020 implicating compulsory licensing of different products related to COVID-19. While the resolutions are non-binding, they incorrectly assume that IP is a barrier to access and underscore the challenges faced by innovators in Chile.

The 2020 resolutions follow several politically-driven Congressional resolutions that have passed in the last few years calling for the compulsory licensing of innovative hepatitis C and other medicines. Starting in 2017, the Chilean Chamber of the National Congress passed a resolution calling on the Minister of Health “to incorporate and use existing compulsory licensing mechanisms to facilitate [medicines] acquisition at competitive prices.”\(^{228}\) In addition, the Chamber approved Resolution No. 1014 in January 2018, seeking to establish that access to certain hepatitis C medicines is not consistent with the constitutional right to health, thus warranting, they assert, a CL. Further, on March

---

9, 2018, the former Minister of Health issued Resolution 399 declaring that the compulsory licensing of hepatitis C treatments would be justified on public health grounds. In June 2018, the Chamber approved Resolution No. 68 asking the Minister of Health to directly request a CL for hepatitis C medicines. On August 28, 2018, the new Minister of Health issued Resolution 1165 rejecting the patentee’s challenge to Resolution No. 399/2018.

The research-based biopharmaceutical industry is very concerned that these actions inappropriately expand the scope of the government’s compulsory licensing authority to pursue objectives that are not clearly related to legitimate health emergencies.

Weak Patent Enforcement

Notwithstanding the requirement contained in Article 17.10.2 of the U.S.-Chile FTA, Chile has thus far failed to establish a satisfactory mechanism to enable effective patent enforcement before marketing approval decisions are made and implemented. Article 17.10.2 requires Chile to “make available to the patent owner the identity of any third-party requesting marketing approval effective during the term of the patent" and “not grant marketing approval to any third party prior to the expiration of the patent term, unless by consent or acquiescence of the patent owner.”

During 2011, the Chilean Government acknowledged to USTR and the innovative pharmaceutical industry that it needed to enact new legislation aimed at establishing an effective patent enforcement mechanism that would bring Chile closer to compliance with its FTA obligations. PhRMA supports a policy framework that: (1) provides sufficient time prior to the grant of sanitary registration of a follow-on product to obtain a final decision regarding the validity of relevant patents; (2) enables patent holders to seek provisional enforcement measures, such as a stay or preliminary injunction, prior to the grant of sanitary registration for a potentially patent-infringing medicine; and (3) excludes the imposition of additional requirements or conditions that might prove unreasonable or unduly burdensome, and that might discourage reasonable patent enforcement efforts (e.g., excessive bond requirements and disproportionately high fines for declarations subsequently judged to be inaccurate).

PhRMA welcomed the government’s work to introduce relevant draft legislation in January 2012. Unfortunately, that legislation has not received any attention since its introduction and, as a result, Chile is still not complying with its international obligations and the impact of a lack of effective patent enforcement continues to worsen.

Inadequate Patent Term Adjustment and Restoration

Over the last several years, INAPI has implemented several administrative and procedural reforms to decrease patent prosecution times, such that most patent applications now receive a definitive decision within three to four years. PhRMA commends Chile’s participation in the Global Patent Prosecution Highway program and
implementation of a Patent Prosecution Highway partnership with USPTO to further improve prosecution time of patent applications.

To the extent that patent reviews can still be delayed, Chilean Patent Law provides all patent applicants the right to request PTA to offset unjustified delays during the patent prosecution process. However, applicants are being denied adequate PTA due to arbitrary interpretations by the TDPI of what constitutes “unjustified administrative delay” during prosecution and narrowly interpreting PTA requests. The TDPI has determined that many types of delays that are outside of the applicants’ control are in fact justified, resulting in inadequate PTA in Chile. Additionally, the TDPI has adopted a very high standard regarding PTR requests in Chile, ruling on several occasions that considerable delays incurred by the Institute of National Health are not to be considered “unjustified administrative delays.”

Trademarks

During 2020, the Conference Committee of Congress reconciling the Medicines II bill approved articles that significantly limit the use of trademarks or other “fanciful” designations for any prescribed medicine. A trademark for a medicine designates its source and helps doctors and patients identify the quality, safety and intrinsic effectiveness of a given product – reputational capital and goodwill that manufacturers strive to build over time. Restricting the use of trademarks for medicines would significantly deviate from the current trademark protection guaranteed in Article 19 N° 25 of Chile’s Constitution and from Chile’s multilateral (e.g., WTO TRIPS) and bilateral (e.g., U.S.-Chile FTA) obligations.

In addition, the Conference Committee approved measures that would severely limit the prescription of medicines based on their trademarked names, by requiring that, absent exceptional circumstances, prescribers use the INNs instead.

Regulatory Data Protection

Final enactment in December 2010 of Supreme Decree 107 resolved some longstanding concerns of the U.S. Government and PhRMA regarding deficiencies in Chile’s RDP system. Nevertheless, Chile’s RDP system contains significant weaknesses, ranging from inappropriate procedural barriers to seek and receive RDP to ambiguous carveouts precluding RDP for certain pharmaceutical innovations (e.g., new uses, formulations, compositions, dosage forms, etc.). Specifically, Chilean regulators inappropriately require innovators to request RDP for specifically identified data and deny RDP in the event subsets of clinical trial data were voluntarily disclosed publicly. Further, regulators are not obligated to protect clinical trial and other data against disclosure after the five-year RDP term has expired.

While Supreme Decree 107 made progress to advance implementation of Chile’s RDP under the U.S.-Chile FTA, WTO TRIPS Agreement and other multilateral
agreements, compliance with these commitments requires further action by the Chilean government to correct these deficiencies.

**Market Access**

**Government Price Controls**

Over the past five years, Chile has improved patients’ access to new medicines more than any other OECD country. Five years ago, only 15 percent of new medicines launched globally over the prior ten years were available in Chile; today, 25 percent of new medicines launched globally over the prior ten years are available.\(^{229}\) However, Chile remains the 5\(^{th}\) lowest OECD country in terms of access to new medicines and patients in Chile wait an average of 32 months from global first launch for new medicines that become available. In addition, Chile is the 3\(^{rd}\) highest OECD country in terms of private out-of-pocket expenditures for health care.\(^{230}\)

Even with the Medicines II bill still pending, the Conference Committee in the Chilean National Congress has approved price regulation proposals that would grant new powers to the Chilean government to directly set the price of patented medicines in the market. Unfortunately, these proposals threaten to reverse Chile’s progress in access to medicines and do not address the underlying reasons why patients in Chile face high out-of-pocket costs for medicines, including insufficient health care coverage and markups in the supply chain.

Industry stakeholders largely have been excluded from consultations regarding these proposals. However, it is widely speculated that the government price controls would be initially limited to patented medicines and involve international reference pricing of other countries in Latin America, nearly all of which have lower GDP per capita. Compounded by heavily devalued currencies throughout the region, these proposals would significantly reduce prices in Chile without creating the policy environment needed to increase patient access and affordability. PhRMA and its member companies stand ready to work with the Chilean government on more practical solutions.

\(^{230}\) OECD Health Statistics 2023, based on data reported for 2021.
THE PEOPLE’S REPUBLIC OF CHINA

China’s leadership has committed to strengthening biopharmaceutical innovation and ensuring Chinese patients have greater access to innovative medicines. These objectives are an integral part of China’s 14th Five-year Plan, Healthy China 2030, and a wide range of health care-related legislative and regulatory reforms. PhRMA and its member companies operating in China are committed to supporting the government’s efforts to build a patient-centered and pro-innovation health care system.

Since the signing of the U.S.-China Economic and Trade Agreement (Trade Agreement) between the United States and China in January 2020, China has taken steps to enhance its IP protection system for pharmaceuticals, including establishing an early patent dispute resolution system, as well as standards for patent term extension (PTE) and adjustment (PTA). PhRMA is further encouraged by China’s ongoing work to strengthen its drug regulatory framework, including its continued commitment to implement guidelines under the International Council on Harmonisation (ICH) and participation in the ICH management committee. On the government pricing front, PhRMA welcomes China’s efforts to annually adjust the National Reimbursement Drug List (NRDL) and support development of a sustainable commercial health insurance industry.

However, significant challenges remain. PhRMA and its member companies remain concerned about the effectiveness of these new IP protections for innovative products, as well as the lack of regulatory data protection (RDP). In addition, the government pricing and reimbursement system remains non-transparent and highly unpredictable. Procedures for securing marketing authorizations can be very lengthy and require substantial commercially sensitive information, diverging from international registration standards. Lastly, rampant counterfeiting of medicines and under-regulated active pharmaceutical ingredients (APIs) are persisting problems.

**Key Issues of Concern:**

- **Weak patent enforcement:** Transparent mechanisms and legal standing to bring suit are needed in China to ensure parties are afforded a meaningful opportunity to resolve patent disputes before potentially infringing pharmaceutical products are launched in the market. Since January 2019, NMPA has granted at least 60 marketing approvals to local drug companies to make infringing copies of innovative medicines while the reference products in each case were still subject to patent protection. While we are encouraged by the issuance of the revised Patent Law and final measures\(^{231}\) to establish an early patent dispute resolution

---

\(^{231}\) Specifically, the NMPA-China National Intellectual Property Administration (CNIPA) Implementation Measures on Early Resolution Mechanisms for Drug Patent Disputes (July 2021) and the Supreme People's Court (SPC) Judicial Interpretation (JI) Regarding Patent Disputes Related to Pharmaceutical Registration Application and Registration (July 2021). In August 2018, the State Intellectual Property Office (SIPO) changed its name to the China National Intellectual Property Administration (CNIPA). Although some of the policies and draft proposals referenced in this submission were issued under the name of SIPO, we have used CNIPA consistently throughout this document.
mechanism, we have concerns about the effectiveness of the resulting system. Moreover, requests for preliminary injunctions for patent infringement lawsuits are rarely, if ever, granted. PhRMA and its member companies stand ready to work with the U.S. and Chinese Governments on the implementation of an effective patent enforcement system in China, consistent with its commitments in Article 1.11 of the Trade Agreement and with a view to establishing an effective and commercially meaningful enforcement system for medicines patents in China.

- **Patent term adjustment (PTA) and extension/restoration (PTE):** We are encouraged that the revised Patent Law, CNIPA draft Patent Law Implementing Rules (PLIR) (November 2020), CNIPA Draft Revised Patent Examination Guidelines (August 2021) and Second Draft Revised Patent Examination Guidelines (October 2022) include language to provide PTA and PTE. However, to date, these provisions have not been implemented. We recommend that CNIPA expeditiously finalize the PLIR and Revised Patent Examination Guidelines, address significant ambiguities and provide further guidance about how the PTA and PTE periods will be determined. Furthermore, it is critical that IP incentives are afforded to all drugs or improved drugs that are new to China (see comments below on New Drug Definition). Limiting these incentives to products that are new-to-the-world would deny PTE to innovative medicines first approved outside of China, which account for the vast majority of innovative medicines approved in China. These revisions are essential for effectuating the patent term compensation provisions in Article 42 of the revised Patent Law and satisfying China’s commitments under the Trade Agreement.

- **Lack of regulatory data protection (RDP):** China committed as part of its accession to the World Trade Organization (WTO) to provide a six-year period of RDP against unfair commercial use for clinical test and other data submitted to secure approval of products containing a new chemical ingredient. However, China does not have a mechanism to apply for or grant RDP and numerous follow-on products approved by NMPA appear to rely on originator clinical data to secure that approval. We urge implementation of an RDP system that is consistent with international best practice and China’s commitment to provide RDP as affirmed in the chapeau to Section C of Chapter One of the Trade Agreement.

- **New drug definition that excludes products previously approved outside of China:** PhRMA and its members are concerned about China’s interpretation of the term “new drug” and its broader policy implications. China has, in practice, maintained the definition of a new drug as one that has not yet been marketed anywhere in the world, (i.e., the drug is not simply new to China), even though this definition is not codified in law or regulation. This position is inconsistent with international standards, under which new drugs are those that are new to a specific country. It also paves the way for China to treat drugs manufactured and approved

---

232 Chemical Drug Registration Categorization and Application Requirements (NMPA No. 44 2020); Biological Product Registration Categorization and Application Requirements (NMPA No. 43 2020).
abroad differently. For example, only “new drugs” qualify for the expedited approval pathway for breakthrough drugs, the recently established PTE mechanism, and the full benefit of former proposals to provide RDP, and only “new drugs” are eligible for the NRDL renegotiation pathway. This globally unique approach is contrary to China’s innovation goals, making it more difficult for both foreign and domestic innovative manufacturers to benefit from proposed policy reforms and engage in the type of meaningful drug research and development and collaboration with partners in China and around the world that promotes innovation. Given the problems that this definition creates, we urge China to clarify “new” to mean newly approved for marketing in China, as opposed to new to the world. A new-to-the-world approach is also inconsistent with the Article 1.12 of the Trade Agreement, under which China agreed to provide PTE to new approved pharmaceutical products in China and China’s commitment under Article 2.4 of the Agreement to treat all parties, both foreign and domestic, equally.

- **Restrictive patentability criteria**: Despite revisions to the Patent Examination Guidelines and judicial interpretations clarifying the ability to consider post-filing experimental data, further reforms are needed to ensure that there are clear, consistent and coherent standards regarding acceptance of post-filing data in China for biopharmaceutical patents, as stipulated in Article 1.10 of the Trade Agreement. In addition, China should provide patent protection for “specific therapeutic methods,” consistent with other major drug markets.

- **Burdensome and nontransparent human genetic resource (HGR) requirements**: China’s HGR regulations prohibit human sample collection by foreign parties and restrict the use, analysis and transfer of such samples and related data except in the context of an approved collaboration with Chinese parties, such as medical institutions or enterprises with no foreign investment. This process has added significantly to the timeline for completion of clinical trials (at times over a year) and carries heavy penalties for non-compliance. By definition, the HGR regulations disproportionately burden U.S. and other foreign companies who may need to export samples and data to complete their clinical trials. The regulations also contain provisions regarding mandatory IP sharing that are inconsistent with Chapter 2 of the Trade Agreement, which provides that any transfer of technology as part of securing marketing approval for innovative medicines occurs on voluntary, market-based terms.

- **Government pricing and reimbursement**: While PhRMA supports the increased frequency of NRDL updates, now annual, the negotiation process for innovative medicines continues to lack transparency and diverges from global best practices. Furthermore, major implementation challenges remain, such as low reimbursement percentages, hospital listing restrictions and other cost control

---

233 Drug Registration Regulation, Article 59 (NMPA 2020).

Regulations, which will continue to restrict patient access to innovative and life-saving medicines. We encourage the Chinese Government to shift towards a more timely, transparent, predictable and evidence-based reimbursement system, in which manufacturers may apply for reimbursement at any time, evidence-based methodologies are adopted for product value assessment and completed within a pre-defined period following the application (e.g., within 90 days) and negotiations between manufacturers and the responsible government agency consider the product’s holistic value and need to incentivize innovation instead of focusing on price cuts.

- **Regulatory approval process**: NMPA has undertaken significant reform efforts to accelerate the drug review and approval process in China and align its regulatory framework with international standards. PhRMA is encouraged by the development of expedited review pathways (breakthrough, conditional approval, priority review and special review) that will facilitate accelerated development and approval of new drugs. However, the qualifying criteria, process and timelines for these pathways need to be more clearly defined. It is also critical for NMPA to issue and implement regulatory guidance and other policies that leverage the best science and innovation to improve the efficiency and predictability of the regulatory approval process.

- **Data requirements for NMPA clinical trial applications (CTAs)**: NMPA has in recent years required an unusually detailed review of the manufacturing and control process at the CTA stage, which can include asking questions that require companies to reveal proprietary information about manufacturing steps and requesting additional data beyond what is required on the face of the application materials. This is not consistent with international practice and is particularly concerning for innovative products including cell and gene therapies. The detailed analysis delays the clinical trials and raises concerns about potential disclosure of manufacturing confidential commercial information (CCI) to third parties.

- **Counterfeit medicines**: We commend the two governments on the commitments in Section G of Chapter One of the Trade Agreement to combat counterfeiting. Over the last several years, China has implemented national plans to improve drug safety and crack down on the production and sale of counterfeit medicines, resulting in several positive and tangible actions on the enforcement front. However, the production, distribution and sale of counterfeit medicines and unregulated APIs continue to pose a problem in China and continue to pose a threat to China’s trading partners. The 2019 Drug Administration Law (DAL) expressly subjects APIs to applicable good manufacturing practice regulations, but also removes APIs from the scope of the definition of drug, which leaves the application of other drug regulations to APIs unclear. Also, the DAL removes the prohibited act of manufacturing or importing unapproved drugs from the definition of counterfeit drug. The DAL now further states that individuals who import small quantities of unapproved drugs that are approved abroad may receive lesser or no penalties. That provision is not limited to drugs that are not for resale. Subsequent
amendments to the Criminal Law in 2021 penalize importation of unapproved drugs that causes or could cause serious human harm. This combination of legislation still gives local officials substantial discretion to allow companies that import unapproved drugs to escape liability altogether or offer lighter penalties if there is no evident harm and the unapproved drugs are in small quantities.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

PhRMA and its members companies strongly support the IP commitments in the Trade Agreement and look forward to securing implementation of these commitments in a manner fully grounded in international best practices. Further work is required to ensure that the final mechanisms are implemented in a manner that advances innovation and patient access, consistent with China’s international commitments, provide meaningful market access and allow U.S. biopharmaceutical companies to compete on a level playing field.

**Weak Patent Enforcement**

PhRMA is encouraged by the issuance of China’s amended Patent Law, the NMPA-CNIPA Implementation Measures and the SPC JI to establish an early patent dispute resolution framework but has concerns about the regime that has been put into place. In addition, although China’s laws and regulations provide for injunctive relief, in practice preliminary injunctions are rarely, if ever, granted in the context of preventing premature follow-on product market entry.

Consistent with Article 1.11 of the Trade Agreement, transparent mechanisms and a legal standing to sue are needed in China to ensure that parties are afforded the opportunity to resolve patent disputes before potentially infringing pharmaceutical products are launched on the market. If a follow-on company begins to market a drug that infringes the innovator’s patents, the damage to the innovator may be irreparable even if the innovator later wins its patent litigation. This could undermine the goal of encouraging innovation in China.

Since January 2019 there have been several instances of NMPA granting market approvals to local drug makers for a variety of generic medicines used to treat common conditions – even though the original drugs are all still under patent protection (including their basic compound patent). To date, we are aware of at least 60 such generic approvals.

This situation has underscored the need for an effective mechanism for early resolution of patent disputes in China. Over the course of 2020-21, responsible agencies released a number of final measures to implement such a system, including amendments to the Patent Law, the NMPA-CNIPA Implementation Measures and the SPC JI. While
aspects of an effective early dispute resolution system are reflected in these measures, the resulting system does not appear to be fit for purpose. Key deficiencies include (i) the scope of patents for which notice would be provided is severely limited for biologics; (ii) the stay period of nine months (with no stay provided for biologics) is inadequate; (iii) the availability of injunctive relief to allow for the resolution of patent disputes outside of or beyond the proposed patent linkage mechanism is unclear; (iv) which declarations by generic or biosimilar companies trigger the ability to initiate an Article 76 dispute is unclear, as is the remedy if a generic or biosimilar manufacturer submits an erroneous declaration; (v) lack of a mechanism for a generic or biosimilar company to change or correct an erroneous declaration (other than refiling the entire ANDA); and (vi) an approval of a generic or biosimilar product is not conditioned on the expiry of the listed patents when a Category 3 declaration is filed (i.e., the generic or biosimilar company promises not to launch its product before the expiry of the listed patents).

In addition, Chinese courts require foreign plaintiffs to submit notarized and legalized formal papers to initiate a case, which are difficult and burdensome to complete within the 45-day period to initiate an Article 76 dispute. Further, while the revised Patent Law creates a cause of action (Article 76), the SPC JI limits the scope of that action to listed patents. This, combined with the fact Article 76 creates a different type of action than a traditional infringement or validity proceeding, means that it is highly unlikely that an Article 76 case alone will resolve the patent dispute (particularly given that the NMPA-CNIPA Implementation Measures offer a 12-month "marketing exclusivity" period to the first generic applicant to successfully challenge the validity of the innovator’s patent). We are also aware of instances where abbreviated new drugs applications submitted before the new patent law took effect have still been approved by NMPA without reference to the patent status of the reference product, even though the patents on those innovative drugs have now been registered.

The lack of efficiency of the Chinese IP court system and the near impossibility of securing preliminary injunctions to keep infringing products off the market have made it very difficult for innovative drug makers to stop patent violations.

We look forward to continuing to work with the Chinese and U.S. Governments to ensure that China implements an effective patent enforcement system consistent with its commitments in Article 1.11 of the Trade Agreement.

Patent Term Adjustment (PTA) and Restoration/Extension (PTE)

The U.S. and Chinese Governments committed in Article 1.12 of the Trade Agreement to provide effective patent term extension mechanisms to compensate for unreasonable delays that occur in granting patents (PTA) and unreasonable curtailment of the effective patent term as a result of the lengthy marketing approval process (PTE) for innovative medicines. PhRMA members are encouraged that China’s revised Patent Law, the CNIPA draft PLIR and 2021 CNIPA draft Revised Patent Examination Guidelines and subsequent revision in October 2022 include language to provide both PTA and PTE. However, to date, these provisions have not been effectuated. While existing applications
should be honored under the amended Patent Law, expiration of an ever-increasing number of the underlying patents may complicate restoration of these patents. In addition, there remains significant ambiguity related to the scope of patents eligible for adjustment and restoration, as well as the scope of protection provided. We recommend that CNIPA expeditiously finalize the draft PLIR and Revised Guidelines to address these ambiguities and provide clear direction as to how PTA and PTE will be determined.

Furthermore, it is critical in these measures that terms such as “new drugs,” “innovative drugs” and “improved new drugs” are defined as drugs or improved drugs that are new to China. Any interpretation that these terms apply a new-to-the-world standard would deny PTE to innovative medicines first approved outside of China, which account for the vast majority of innovative medicines approved in China. These revisions and clarifications are essential for effectuating the patent term compensation provisions in Article 42 of the revised Patent Law and satisfying China’s commitments under the Trade Agreement.

Lack of Regulatory Data Protection

We urge China to adopt measures that are consistent with international best practices and China’s WTO commitments to provide RDP,235 as affirmed in the chapeau to Section C of Chapter One of the Trade Agreement, in order to prevent the unfair commercial use of safety and efficacy data generated by innovative pharmaceutical companies. While we note RDP’s inclusion in the draft May 2022 Drug Administration Law Implementing Regulations (DALIR) and in prior regulations and proposals, as it stands, China provides no period of protection during which a non-originator (or follow-on) applicant is prevented from relying on the data submitted to NMPA or a foreign regulatory agency to secure approval of the originator product. This practice gives an unfair commercial advantage to the follow-on manufacturer by permitting it to rely on the full clinical data submitted by an innovator – which the follow-on manufacturer did not incur the costs to produce – while having to submit only a small amount of China-specific supplemental data to NMPA.

Furthermore, RDP should be granted in full to any product that is “new” to China, i.e., has not been approved by NMPA. Prior proposals, however, suggest that China would only grant full RDP to pharmaceutical products that are “new” to the world – in other words, products that make their international debut in China.236 That is at odds with the

---

235 As part of its accession to the WTO in 2001, China committed to provide a six-year period of RDP for undisclosed test or other data submitted to obtain marketing approval for pharmaceuticals in accordance with Article 39.3 of the WTO Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). See Report of the Working Party on the Accession of China to the World Trade Organization, WT/MIN(01)/3 (Nov. 10, 2001), at para. 284. Article 39.3 provides that a country must protect data submitted in the context of a drug registration application from unfair commercial use.

236 NMPA continues to draw distinctions between drug applications in China relative to approvals in other countries. The February 2016 NMPA “Chemical Drug Registration Category Work Plan,” defined a “new drug” as a chemical entity that is “new to the world.” Although this definition is contrary to international practice and the definition in the earlier DAL Implementing Regulation itself, NMPA continues to utilize
approach of other regulatory systems and even at odds with the approach taken in China with respect to RDP for agricultural chemicals. PhRMA is concerned that this definition of “new drug” or similar concepts may continue to create risk that a drug approved or marketed first outside of China may receive weaker or no protection in China. This approach would also be discriminatory in that it would favor domestic industry, contrary to China’s international obligations.

Restrictive Patentability Criteria

While PhRMA appreciates revisions to the Patent Examination Guidelines and judicial interpretations clarifying the ability to consider post-filing experimental data, further reforms are needed to ensure that there are clear, consistent and coherent standards regarding acceptance of post-filing data in China for biopharmaceutical patents, consistent with other major drug markets. Such standards must reflect the realities of the drug development lifecycle.

For example, unlike patent offices in the United States, Europe, Japan, Korea and other major markets, CNIPA does not consistently accept data submitted after a patent is filed to satisfy sufficiency and inventive step requirements, pursuant to Articles 26.3 and 22.3 of China’s Patent Law, respectively, and as stipulated in Article 1.10 of the Trade Agreement. This practice has caused uncertainty about the ability to obtain and maintain biopharmaceutical patents in China, and has caused denials of patents on new medicines in China that received patents in other jurisdictions.

In addition, “specific therapeutic methods” cannot be protected by patents in China. New specific therapeutic methods are new methods of treatment of a known indication with a known product (such as new dosage regimens, treatment of new subgroups of patients or new routes of administration). They are distinguished from new product forms (such as dosage forms and formulations), manufacturing processes and treatment of new indications, which can be protected by patents in China either directly or through use of the Swiss-type claim format. Most countries with strong IP laws provide patent protection for specific therapeutic methods either directly (by permitting methods of treatment to be patented) or indirectly (by permitting alternative claim formats, e.g., Swiss-type claims). Incentives to develop such new specific therapeutic methods should be provided by the patent system because such new uses of existing medicines can bring important patient benefits, including methods of treatment specific to the Chinese population that may not be developed in the absence of a local incentive to do so. We urge CNIPA to revisit this gap in China’s patent system and conform China’s practice to that of many other countries.

__________________________
this concept to grant priority to certain applications. NMPA is also proposing that only products “new to the world” would qualify for full RDP terms (in an April 2018 draft of NMPA measures on the Implementation of Drug Clinical Trial Data Protection). Applicants that submit marketing applications in China before or at the same time as other countries receive benefits; those who submit later in China receive less. The 2020 DRR contains a separate application category for drugs approved abroad but not in China, which could be used to perpetuate this disparate treatment of drugs approved abroad.
Mandatory IP Sharing Related to HGR Requirements

Any research conducted by foreign companies using Chinese human biological samples must be undertaken in collaboration with Chinese partners (e.g., Chinese state hospitals) under the HGR regime and their “international collaboration” approved by the Human Genetic Resource Administrative Office (HGRAO) under the Ministry of Science and Technology. Both the original 1998 HGR Regulation and the 2019 amended version require that (1) the foreign and Chinese party jointly submit and own any patent applications in China arising from the results of any exploratory research; and (2) the two parties agree on an arrangement for rights to other intellectual property (e.g., know-how or data) or, in the event that there is no arrangement, jointly share the rights and benefits to this IP, including obtaining the consent of the other party to transfer those rights and sharing benefits according to their respective contributions. In practice, these rules mean that the HGRAO requires the parties to agree to jointly own the patents to the results of exploratory research even if a party does not have any inventorship contributions and in several cases also the underlying data. While not necessarily impacting rights over the investigational product, applicants are required to submit their clinical trial agreements (including the IP-related provisions) and insert or summarize those IP provisions in the application to HGRAO for international collaboration approval, sometimes requiring a negotiation with HGRAO that creates uncertainty as to the rights over certain aspects of pre-market research (e.g., exploratory endpoints) and post-marketing studies. The Second Draft Revised Patent Examination Guidelines (October 2022) also include concerning provisions that may limit the ability for companies to patent inventions if CNIPA deems that the applicant has not complied with HGR requirements.

The IP sharing requirement and the HGR application process together form a significant hurdle and create uncertainty for foreign companies conducting clinical research in China. The mandatory IP sharing requirement should be eliminated to ensure, consistent with Chapter 2 of the Trade Agreement, that any transfer of technology as part of securing marketing approval for innovative medicines occurs on voluntary, market-based terms.

Lack of Transparency in Patent Prosecution

According to Article 48 of the Implementing Regulations of the Patent Law, any person may, from the date of publication of a patent application till the date of allowance, submit observations as to why the application does not satisfy the patentability criteria. In turn, section 4.9 of Part II Chapter 8 of the Patent Examination Guidelines provides:

The observations submitted by anyone to the Patent Office on an invention application not in conformity with the provisions of the Patent Law shall be included in the application file. The examiner shall take them into consideration during substantive examination …. The handling of the observation submitted by the public does not need to be notified to the public concerned. (Emphasis added.)
Promisingly, this provision and process was not included in the proposed revisions to the Implementing Regulations of the Patent Law. In the event, however, that third-party observations are maintained in China, it is critical that China provide basic transparency and due process as part of its patent prosecution process. In particular, patent applicants should be notified of the submission of third-party observations and offered the opportunity to rebut any allegations that they contain.

**Market Access**

**Government Pricing and Reimbursement**

To appropriately address patient access and affordability challenges, PhRMA urges China to establish a more timely, transparent, predictable and evidence-based reimbursement system, in which manufacturers may apply for reimbursement at any time, evidence-based methodologies are adopted for product value assessment and completed within a pre-defined period following the application (e.g., within 90 days), negotiations between manufacturers and the responsible government agency occur more periodically (e.g., semi-annually) and consider the product’s holistic value and need to incentivize innovation instead of focusing on price cuts. Such a comprehensive and sustainable policy framework should also include an enhanced role for commercial health insurance (CHI), including by ensuring that the relationship between Basic Medical Insurance (BMI) and CHI is clearly defined and that systems can interact seamlessly, encouraging CHI products to include coverage of pre-existing conditions and consumer protection mechanisms, and addressing data availability and management limitations that hamper actuarial modeling and the ability to create viable insurance products, including encouraging the sustainable development of City Supplementary Commercial Health Insurance. Moreover, a seamless relationship between CHI and BMI can play an important role in the development of dedicated, multi-party payment models to increase access to innovative medicines, including medicines for rare diseases. PhRMA and its members are committed to working with the appropriate government authorities in China to assist in the timely and transparent development of this policy framework.

**National Reimbursement Drug List**

PhRMA welcomes recent annual updates to the NRDL, which have improved access and affordability of innovative medicines for patients in China. While any additions to the NRDL are a positive development, the negotiation process for these new medicines continues to lack sufficient transparency and diverge from global best practices. The product selection and assessment criteria appear to be based on narrowly defined dimensions of value and budget impact, without clarity on how these criteria are determined and applied. Furthermore, even when prices are established, there remain major implementation challenges, such as low reimbursement percentages, hospital listing restrictions and additional cost control regulations that continue to restrict patient access to innovative and life-saving medicines. Only 24 percent of new medicines
launched globally since 2012 are available in China and patients wait an average of 43 months from global first launch for new medicines that become available.\textsuperscript{237}

Moreover, contract renewal and in certain cases full price renegotiation are required two years after NRDL listing, which can result in irreversible reductions in the payment standard (i.e., the reimbursed price) without any mechanism for positive adjustment based on the demonstrated benefits of the product. PhRMA acknowledges that the NHSA’s 2023 NRDL rules have somewhat lessened reductions in the payment standards for medicines that have been on the NRDL for several years. PhRMA also welcomed the deletion of language in the 2020 NHSA Interim Administrative Measures for the National Reimbursement Drug List that would have prioritized products with “independent intellectual property” (i.e., developed and owned by a Chinese legal entity) for inclusion in the NRDL. However, we note that the 2023 NRDL negotiation rules only allow companies to request renegotiations of payment standards during the contract renewal if the medicines are “new to the world”; medicines first approved outside of China do not qualify. This is yet another example of how China is defining “new drug” to impermissibly favor domestic industry.

PhRMA recommends that the Chinese Government continue to take steps to improve the clinical assessment, economic assessment, negotiation process and BMI fund allocation for including innovative medicines in the NRDL. The clinical assessment should be a transparent, evidence-based and comprehensive analysis of scientifically proven clinical benefits that is independent of economic considerations. Following the clinical assessment, a transparent and evidence-based framework that holistically reflects the clinical, economic and societal benefits and costs – as opposed to the current focus on lowest international reference prices and cost-effectiveness thresholds – should be established before conducting individual product negotiations. Greater clarity and engagement with industry and other stakeholders is needed regarding these issues, including assessment and budget impact analysis criteria, standards for appropriate comparator selection, flexibility to address challenges for particular therapy areas and rare diseases, and new pathways for companies to pursue innovative payment arrangements. Selection standards for individual expert groups that support these assessments should also be more scientific and transparent. Negotiations between the national reimbursement authority and the manufacturer should be based on clear conditions and standardized documentation, with sufficient time for companies to prepare submissions and open communication channels before, during and after negotiations to resolve any issues. Finally, PhRMA recommends that the Chinese Government continue to improve and accelerate NRDL implementation (e.g., hospital listing of negotiated drugs) to improve patient access to innovative medicines.

PhRMA and its member companies seek to work with the Chinese Government to improve NRDL policies. Needed reforms would increase the transparency and predictability of the Chinese market, more appropriately recognize the value of innovative medicines.

medicines and provide PhRMA member companies increased market access that leads to improved patient access.

**Volume-Based Procurement (VBP)**

In late 2018, NHSA initiated a VBP pilot program to centrally procure off-patent and generic products that passed a generic quality consistency evaluation (GQCE) for all public hospitals in 11 cities, which collectively represented around a third of the Chinese biopharmaceutical market. Twenty-five of the 31 molecules proposed for procurement were selected based on the lowest bidders, with an average price cut of 52 percent. In September 2019, the Chinese Government expanded the program to most of China but modified the procurement methodology to allow three suppliers with the lowest bids. Subsequent procurements organized by the National Drug Joint Procurement Office (the procurement agency authorized by the NHSA) have increased the number of allowed suppliers for individual medicines. For example, the second national VBP allowed six suppliers with the lowest bids and the third national VBP allowed eight suppliers with the lowest bids. While allowing multiple winning bidders is a positive development, PhRMA urges the Chinese Government to ensure that the national VBP program does not reduce the number of quality suppliers in the market, increase the risk of drug shortages or hinder patient and physician choice in selecting the clinically most appropriate medicines. PhRMA encourages the Chinese Government to provide additional sales channels to ensure that patients have the full range of treatment options available.

As articulated in China’s Health Security 14th Five Year Plan, by the end of 2025, the national and provincial VBP programs will include as many as 500 medicines that have GQCE-certified generics. The NHSA is also expanding the national VBP program to biologic products, beginning with insulins in November 2021 and then other types of biologic products, including biosimilars. To ensure patient safety, PhRMA recommends that biosimilars demonstrate strong and specific scientific, clinical and quality standards. To this end, the Chinese Government should improve the regulatory framework for biologic products before expanding the national VBP program to biologic products, including through clear, science-based policies on naming, pharmacovigilance, interchangeability, extrapolation of approved indications of reference biologics and production capability. With the appropriate regulatory framework in place, PhRMA encourages the Chinese Government to develop a tailored biologic VBP model that recognizes value, ensures patient safety and therapeutic continuity, allows for shared decision-making between physicians and patients and incentivizes innovation.

New concerns with the national and local VBP programs and tendering platforms have emerged with respect to the protection of IP rights. For example, the list of products announced for the fourth national VBP in 2020 included a compound for which the patent was still valid and for which an administrative lawsuit was in progress. In 2021, the announced procurement methodology for the sixth national VBP grouped patented and off-patent products in the same class for competitive lowest price bidding. PhRMA urges the Chinese Government to abandon the practice of including patented medicines (including, but not limited to, patents on compounds and medical use patents) in the
national and local VBP and tendering platforms, which abrogates innovator’s IP rights and, in the case of therapeutic class tendering, treats as interchangeable products with very different clinical characteristics and performance.

In conclusion, PhRMA is committed to working collaboratively and expeditiously with the appropriate government authorities to resolve these concerns and to implement transparent government pricing and procurement policies that recognize quality, innovation and the value that our member companies’ products bring to patients and China.

**Regulatory Approval Process**

China has made significant strides in reforming and strengthening its regulatory framework, including shorter review times for CTAs (notwithstanding unique manufacturing documentation requests) and expedited programs. Although there have been a number of examples where NMPA granted expedited regulatory approval consistent with timelines in the United States and European Union (or even faster), further improvements are needed to consistently match the review times for other regulatory authorities. We encourage China to address these issues rapidly, given the promise that a significant number of therapies currently in development have shown and the importance of predictable and timely review processes to encourage innovators to bring these new therapies to China for regulatory approval.

PhRMA is encouraged that the 2019 DAL and certain aspects of the 2020 Drug Registration Regulation (DRR) have implemented reforms to speed up the approval process for some drugs. This supports greater flexibility in the drug development process, including a shortened notification process to initiate clinical trials and strengthened channels for stakeholder-NMPA communications. Furthermore, we support NMPA’s implementation of various conditional approval programs, including for three lists of drugs approved in the U.S., Europe and Japan that China considers to be urgently needed for clinical use. We also support the issuance of guidance in July 2018 on the acceptance of overseas clinical trial data followed by the new clinical technical requirements for drugs approved overseas but not yet in China in October 2020.

NMPA’s involvement in ICH since its May 2017 accession to the ICH and successful election to the ICH Management Committee in 2018 further exemplifies China’s reform efforts. In 2021, NMPA was re-elected to the ICH Management Committee. Being an active ICH member will further encourage NMPA’s harmonization with international regulatory standards, including the China Pharmacopeia 2020, implementation of harmonized global regulatory practices (including good manufacturing and clinical practices) and further implementation of standardized electronic submission for new drug applications (eCTD) and safety reporting, which will enable companies to pursue global simultaneous drug development and accelerate Chinese patient access to innovative medicines. Industry and other ICH stakeholders have high expectations for NMPA to implement fully ICH’s technical guidelines through the support of relevant training programs.
Clinical Trial Applications

To help China further integrate into the global innovation network and reduce the time it takes for innovative medicines to reach patients, it is critical for China to shorten the CTA review and approval time. As discussed above, China now permits a new drug clinical trial to move forward if NMPA has not raised objections within 60 business days. PhRMA recognizes these important steps NMPA has taken to make the development process more efficient.

But there is still more that could be done. Based on PhRMA member company experience in other major markets, NMPA should maintain consistent and specific timelines for reviewing and approving applications. In addition, applications should be evaluated based on a clear set of standardized criteria coupled with science-based and risk-based decision making (principles embedded in ICH guidelines) that applies equally to both local and foreign manufacturers and matches the stage of development.

Specifically, we are encouraged that the 2019 DAL and 2020 DRR create a more uniform system that does not draw distinctions between local trials and international Multi-Regional Clinical Trials (MRCT). To enable simultaneous global development and facilitate access to innovative treatments, we encourage China to fully implement ICH E-17 (MRCT) guidelines and accept a pooled region approach as well as sample size allotments for Chinese patients. In addition, it is critical that laws seeking to protect data and patient privacy in China do not unduly hinder China’s ability to participate in MRCTs efficiently and effectively.

i. Human Genetic Resources Requirements

One of the more significant impediments to development has been an additional approval or notification now applicable to all trials conducted in China by foreign companies or their affiliates that collect any samples that contain Chinese human genetic resources, regardless of whether those samples are for genetic testing. Pursuant to HGR Regulations that have been in effect since 1998 (but were largely unenforced until 2015) foreign applicants must apply to the HGRAO before they can collect and transfer these samples and associated data. The trial may not commence until this process is complete. While the final HGR Implementing Rule issued in 2023 appears to have loosened some restrictions to be able submit a notification (rather than an approval application) for trials that are intended to support a marketing application in China, the effects of the rule remain to be seen and, as before, trials with the need to export samples and data still require full approval.

The HGR application process can add months to the development timeline. Under the 2019 amendment, applicants must file any data that they intend to transfer outside of China with the HGRAO. This situation presents a hurdle for China to participate in global development, particularly for early-stage trials, and contradicts various reform policies to encourage innovation. The additional conditions for HGR research by foreign companies, limitations on data transfer and storage, and IP sharing requirements described above in
the section on Mandatory IP Sharing Related to HGR Requirements raise serious questions about China’s compliance with its international commitments, including Article 3(1) of the TRIPS Agreement, which prohibits the granting of less favorable treatment to foreign intellectual property right holders compared to national intellectual property right holders and Article 2 of the Trade Agreement. The HGR requirements – which are unique to China – disproportionately burden foreign companies. If not eliminated entirely, they should be reduced to a simple notification procedure without restrictions on export of samples and data.

\[\text{\textit{ii. Chemistry, Manufacturing and Control Data Requirements}}\]

An additional concerning impediment to development is NMPA’s unusually detailed information requests for the manufacturing process at the CTA stage, which can include asking questions that require revealing proprietary information about manufacturing steps and requesting additional data beyond what is required on the face of the application materials. This is not in line with international best practice. The detailed information required not only delays the clinical trials but also raises concerns about potential disclosure of manufacturing CCI to third parties, such as during copy or transport of the information. NMPA has been hesitant to permit redactions of these records or accept less sensitive substitutes when making such requests. The NMPA requests for detailed information continue throughout the product life-cycle, including for NDA and post-approval submissions.

\[\text{\textit{Drug Approvals Process}}\]

PhRMA welcomes a number of other key regulatory reforms described above because they represent positive movement in China’s progress toward supporting a simultaneous global development and registration framework in China. These reforms are consistent with industry’s primary recommendations, including full implementation of the ICH E17 guideline, strengthened expedited programs, acceptance of foreign clinical data to satisfy registration in China, structured agency consultation and the establishment of a rare disease list. Although the establishment of an orphan disease list in 2018 was an encouraging step to better serve patients with rare diseases, the first list only contains 121 rare diseases of the about 8,000 rare diseases in total known today. In September 2023, China further included another 86 rare diseases in the list. As it is impossible to create a complete list, PhRMA suggests replacing this list with a definition of prevalence, which is the approach taken in the United States and by other ICH regulatory agencies. The rare diseases community in China has already developed and published a report for a definition based on prevalence of the disease that could be considered. In addition, PhRMA encourages China to pair the establishment of an orphan disease definition with an orphan drug regulatory framework that provides for the expedited development and review of orphan drugs, as well as regulatory incentives. We note that the 2022 draft DALIR contains incentives for orphan drugs, and recommend clarification that the references to “new” in these provisions mean the orphan drug is new to China, as opposed to new to the world.
The 2019 DAL adopted a marketing authorization holder (MAH) system nationwide and applies it to ex-China applicants. This system unifies the previously separate imported and domestically made drug pathways in certain ways. Applicants can now receive a marketing authorization tied to a product and have the freedom to contract out manufacturing and distribution to multiple partners, as long as it does not involve cross-border manufacturing. However, for biologics there are still restrictions on China cross-border segmented manufacturing and use of CMO within China as the sites must be in the same province and listed on the same manufacturing license. Also, the 2019 DAL unifies what were previously separate applications for the drug product, the active ingredient, excipients and primary packaging materials. Materials related to the latter three will be registered to certain applicants as part of a mandatory drug master file (DMF) system that began in 2017. Although the bundled system streamlines the review process, some of the required administrative and technical information for a DMF is burdensome for the companies as well as their suppliers and it is unnecessary to ensure product quality and safety. PhRMA recommends that the DMF system should be voluntary as is the case in the United States and the European Union. We are also concerned about the dual standards for API produced in China. API produced in China to be exported is not approved by the NMPA, unless there is an import GMP certification requirement. This approach is contradictory to the very strict and regulated standard applied to API used in products for the Chinese market.

We also recommend China eliminate rules that tie the location of the MAH and the clinical trial applicant to the location of manufacturing, and that essentially prohibit manufacturing and supply steps from taking place across borders. These rigid silos and distinctions between imported and domestic drugs are not productive and result in unnecessary costs and challenges to segmented and cross-border supply chains. This approach appears to be maintained in the 2022 draft DALIR revision, even though it is not called for in the Drug Administration Law. We urge China to expressly state that an MAH can be located in China or abroad, regardless of where some or all of the manufacturing takes place or the type of product (e.g., small molecule drug or biologic).

To ensure Chinese patients receive timely access to new therapies, PhRMA recommends that NMPA continue to align its regulatory framework with accepted international standards and adopt science-based, transparent, consistent and predictable policies for evaluating and approving drugs and biologics. For example, on January 12, 2021, NMPA issued a Regulation on Post-Marketing Changes of Drugs, which speaks to the requirements that must be met for any post-approval variation to an approved medicine. Whereas international standards typically allow for the drug product to be manufactured but not released until approval of the change is obtained, this Regulation restricts the manufacture of the drug product until after the regulatory approval (or notification) of the change has been issued. Such an approach could negatively impact the supply of medicines – particularly biologics and vaccines with long manufacturing lead times – to the detriment of patients. PhRMA recommends that the NMPA align its approach for post-marketing approval changes with international practice. While we are encouraged by the draft DALIR revision provisions that would permit drugs manufactured prior to NMPA approval to be marketed, provided they meet requirements in their
applicable good manufacturing practice, we recommend this approach apply to post-
approval changes as well.

PhRMA commends NMPA on its continued leadership at ICH and encourages its
timely and robust implementation of all ICH guidelines. PhRMA recommends continued
reforms to accelerate and simplify the drug regulatory approval process, unify
requirements and practices for locally manufactured and imported products and clearly
outline and streamline the criteria and timeline for reviewing and approving clinical trial
and marketing application processes. PhRMA and its members stand ready and look
forward to working closely with the U.S. and Chinese Governments to support China’s
regulatory reform efforts.

Foreign Investment Restrictions

China has removed a number of restrictions on foreign investment in recent years.
Indeed, research and development and production of drugs using cell therapy technology
and new drug production using bioengineering (excluding prohibited foreign investment
areas) are currently encouraged areas under the 2020 Encouraged Foreign Investment
Catalogue. However, pursuant to its Foreign Investment Negative List, China still flatly
prohibits foreign investment in “the development and application of human stem cells,
genetic diagnosis and treatment technology[.]”

This ambiguous provision could be interpreted to prohibit foreign companies from
providing life-saving technologies including cell and gene therapies to China. Such a
blanket prohibition on foreign investment and participation would make China an outlier
in this area among other innovative markets, as the United States, the European Union
and the United Kingdom do not contain such categorical restrictions in their laws. We
urge China to eliminate this language in the Negative List or to define it to expressly
exclude development and production of biological products, including cell and gene
therapies, for commercial marketing.

Counterfeit Medicines

Pharmaceutical counterfeiting poses global public health risks, exacerbated by
rapid growth of online sales of counterfeit medicines and the production and sale of
unregulated APIs used to manufacture counterfeit products. China has increased
enforcement efforts against counterfeited drugs in recent years, both through legislative
reforms and increased police activity, and we commend the two governments on the
commitments in Section G of Chapter One of the Trade Agreement to combat
counterfeiting. In implementing these commitments, it will be particularly important to
address online distribution of counterfeit medicines and unregulated API. Stories involving
counterfeit medicines continue to make headlines, such as an arrest in 2021 of a manufacturer of fake COVID-19 vaccines in China.  

Under current pharmaceutical regulations, there is no effective regulatory control over the manufacture and distribution of API, which creates a major regulatory loophole that exerts a negative impact on the security of China's upstream drug supply chain and creates the possibility for API produced in China that is not NMPA approved to be exported globally. The 2019 DAL states that APIs used in drug production must comply with good manufacturing practice regulations and that drug producers must verify the compliance of APIs they purchase. But the DAL is not clear on the applicability of other regulations to APIs as it has removed API from the definition of “drug.”

The DAL also contains provisions on a system for drug traceability. This includes building upon existing efforts to establish an online platform for collecting and publishing traceability records and a requirement for a unique identifier according to uniform coding rules on each drug package. In addition, the DAL also contains increased fines and longer debarment penalties for counterfeiting. These provisions are helpful, but further measures are still needed to adequately address the problem, including:

- amending the Criminal Code to ease the burden of proof to prosecute brokers or API suppliers who knowingly deal with illegal APIs;
- empowering NMPA or another authority to regulate any party that manufactures API even if that party has not declared an intent to do so;
- empowering NMPA (through implementation of the revised DAL) to penalize API manufacturers based on *prima facie* evidence of a product having medicinal use or being an “API” or a “chemical drug substance” without cGMP certification; and
- deepening cooperation with major Internet Service Providers, portal sites and search engines for earlier identification and tracking of illegitimate API suppliers through business-to-business websites.

While the State Administration for Market Regulation plays a critical role in developing future solutions, any significant reform plan will require coordination and consultation among all relevant ministries within the central government. These efforts to crack down on unregulated API must go hand-in-hand with China’s efforts against counterfeit drugs in order to enhance the effectiveness of China’s national drug safety plan objectives.

---

239 See DAL Chapter 11. The potential fines for manufacturing or distributing counterfeit drugs increased from 2 to 5 times the value of the goods to 15 to 30 times the value of the goods with a minimum fine of RMB 1,500,000 (about USD 208,000). These entities can be debarred for 10 years. The maximum penalty for a responsible person increased from ten years’ debarment to lifetime debarment from the pharmaceutical industry. For severe violations, the police department may detain the responsible person for five to 15 days.
PhRMA hopes that the U.S. Government will work with China to increase transparency of its anti-counterfeiting efforts, including enhancing information sharing with drug manufacturers to help evaluate the effectiveness of online actions and supporting enforcement efforts, given the importance of protecting patients. China’s actions in this area could serve as a model for other countries facing similar challenges online.

PhRMA encourages the Chinese and U.S. Governments to continue and increase further their cooperation related to counterfeit medicines sold on the Internet, given the role of the Internet in the global counterfeit drug trade. This notably requires a holistic approach since not only finished counterfeit medicines are sold on the major online platforms in China but also separate materials (i.e., API, secondary packaging, primary packaging, labels) especially on business-to-business platforms for these to be assembled in and outside China.

Finally, while we commend China for improvements in customs regulations, which include monitoring and seizure of imports and exports, Chinese Customs authorities rarely exercise their authority to monitor pharmaceutical exports. PhRMA believes that Customs authorities need clear guidance, more and better trained resources and support should be targeted to monitoring pharmaceutical and chemical exports to ramp up efforts against counterfeiting and unregulated API producers. This could include, for example, encouraging greater cooperation between Chinese Customs and the Public Security Bureau to ensure the identification and prosecution of those manufacturing and exporting counterfeit medicines. In addition, Chinese Customs should consider working with the World Customs Organization to exchange information and potentially align activities, as well as customs authorities in recipient countries to jointly combat pharmaceutical crime. Close cooperation and intense risk analysis with key intermediaries such as online e-commerce platforms and postal courier companies is critical to effectively monitor and detect small parcels with counterfeit medicines. Legal mechanisms should be established that incentivize e-commerce platforms and postal courier companies to monitor, analyze and share intelligence on transactions that may involve counterfeit medicines.
COLOMBIA

PhRMA’s member companies face urgent market access challenges and intellectual property (IP) issues in Colombia. Significant market access barriers have arisen from the Colombian Government’s adoption of cost containment measures, which aim to address overall health care spending by disproportionately imposing price reductions and fixed budgets on prescription medicines. Other barriers include Decree 1782 of 2014, which establishes an unprecedented “third pathway” for approval of non-comparable biologics contrary to World Health Organization (WHO) guidelines and accepted standards of the United States and other countries. Industry has also faced increasing regulatory delays and product denials over the last few years in both securing and renewing marketing authorizations, thereby reducing patient access to innovative medicines. Regarding IP, innovators continue to face compulsory licensing challenges in Colombia, which signals to biopharmaceutical innovators that their patents may not be safe and dissuades them from investing or entering into arrangements with local entities to introduce new innovative medicines. Also, Colombia’s food and drug regulatory authority (INVIMA) has adopted a new interpretation of the regulatory data protection (RDP) Decree 2085 of 2002. According to that interpretation, INVIMA denies RDP upon approval of some new chemical entities, simply because they share a minor portion of their chemical structure with previously approved products.

Key Issues of Concern:

- **Compulsory licensing**: Compulsory licensing in Colombia is a continued risk to the innovative biopharmaceutical industry. In October 2023, the MoH issued Resolution 1579, which establishes a Declaration of Public Interest (DPI) related to an antiretroviral medication. A DPI is a prerequisite to issuing a compulsory license in Colombia. In addition, in December 2017, the MoH accepted a DPI petition for review that could lead to the compulsory licensing of the entire class of innovative treatments for hepatitis C. Industry is concerned about the continued interest within the MoH to consider the use of compulsory licensing, particularly when other options exist which would not compromise incentives for innovation.

- **Regulatory data protection failures**: Colombia fails to respect existing legislation that would otherwise provide RDP upon approval of novel pharmaceutical products.

- **Restrictive patentability criteria**: Contrary to its obligations under the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS), Colombia does not grant patents for second uses.

- **Effective patent enforcement**: Despite having a specialized court under the auspices of the Superintendence of Industry and Commerce (SIC) designed to address IP infringement matters, Colombia needs to implement effective early resolution mechanisms that provide for the timely resolution of patent disputes.
before marketing approval is granted to infringing follow-on products during the patent term through increased collaboration between INVIMA and SIC.

- **Substandard biologics regulation:** On September 18, 2014, Colombia issued Decree 1782, which establishes marketing approval evaluation requirements for all biologic medicines. As part of the Decree, Colombia created an unprecedented “abbreviated” pathway for the registration of non-comparable products, which is inconsistent with WHO guidelines and accepted standards in the United States and other countries, and which could result in the approval of medicines that are not safe and/or effective. Industry urged the Colombian Government to remove this third pathway from the Decree, but was unsuccessful.

- **Cost containment measures focused solely on the biopharmaceutical industry:** Government measures to improve the sustainability of the Colombian health system have focused solely on the biopharmaceutical industry and have not addressed broader issues within the pharmaceutical supply chain or other health care sectors. For example, in 2020, the Colombian Government issued regulations to limit expenditures on medicines not included in the publicly funded Health Benefit Plan (HBP) based on historical levels that would effectively restrict new innovative medicines from entering the country. These measures have been criticized for their technical shortcomings by virtually all sectors of the health system and academia.

- **Maximum reimbursement values:** With resolution 3514 of 2019, the Ministry of Health and Social Protection (MoH) established reimbursement caps (“Valores Máximos de Recobro” or VMR) for more than one thousand products reimbursed by the government. Maximum values per unit for each active ingredient are calculated based on past reimbursement values, adjusted for inflation, using a formula that skews toward lower prices by taking the 25th percentile of these values for multi-sourced products and the 10th percentile for single-sourced products. The reimbursement caps came into effect in May 2019 for 50 medicines and in January 2020 for the remaining group of medicines. These caps have reduced reimbursement across all impacted medicines (including single source, biologics and branded generics), some by as much as 50 percent. Additional products subject to reimbursement caps were announced in August 2021, impacting both the institutional and retail sectors.

- **New drug price regulation methodology:** In 2019, the National Drug Pricing Commission (NDPC) began a review of its price regulation methodology. The Commission is expected to make its system of international reference pricing (IRP) more restrictive by expanding the number of reference countries from 17 to 19 and changing the mix of countries to include those that are less supportive of innovation. A draft circular was published by MOH in September 2023, outlining a new method for pricing new medicines. In addition to IRP, the resolution includes a value-based pricing model based on therapeutic and economic assessments undertaken by the *Instituto de Evaluación Tecnológica en Salud* (IETS). Industry
concerns raised since 2019 should be discussed through an open and timely consultation process ahead of any new drug pricing methodology.

- **Persistent regulatory barriers under the National Development Plan:** Colombia’s 2014-2018 National Development Plan (NDP), which was enacted as part of Law 1753 in May 2015, undermines gains Colombia has made to encourage innovation, delays access to cutting-edge technologies and is inconsistent with Colombia’s international commitments. Concerns include Article 72, which inserts price and health technology assessment (HTA) criteria into the regulatory approval process that should be guided by safety, efficacy and quality; continued uncertainty over price and value definitions for new molecules under consideration by the government, and the MoH playing a duplicative and possibly more restrictive role in HTA apart from the IETS.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Compulsory Licensing**

In October 2023, the MoH, through Resolution 1579, issued a DPI related to an antiretroviral medication, an important precursor to issuing a compulsory licensing on that product. According to the technical body created by Decree 2699 of 2007 to study the burden of particular diseases in Colombia, including HIV, between February 2021 and January 2022, 88.35 percent of Colombian patients had access to antiretroviral treatments.240 Rather, it appears MoH is seeking to leverage compulsory licensing simply to achieve further price cuts, even though the price in Colombia for this product is the lowest in the region. U.S. administrations have specifically called out such practices, and made clear that compulsory licensing should not be used as undue leverage in pricing negotiations.241

Resolution 1579 follows repeated CL threats in Colombia. In December 2017, the MoH issued Resolution 5246 accepting for review a DPI petition calling for the compulsory licensing of the entire class of innovative medicines for the treatment of hepatitis C, following a similar petition granted against an innovative cancer medicine in 2016. Resolution 5246 is both legally and procedurally deficient. First, Resolution 5246 is based on a petition that failed to identify the patents for which the DPI is being requested. As set forth in Decree 1074 of 2015, the burden of proof is on the petitioner to identify the patented technologies that are supposedly affecting the public interest. Second, a DPI on a broad category of medicines, namely “antivirals for treatment of hepatitis C” would be

baseless for a number of reasons, including that: a) the petition itself identifies an entire class of medicines, a class within which significant competition already exists; b) hepatitis C drugs were the subject of significant price reductions in Colombia, which the Ministry itself has publicly asserted were between 80 and 90 percent; and c) there is no indication that a health-related emergency regarding hepatitis C exists in Colombia. To the contrary, the incidence of hepatitis C is quite low in Colombia. Promisingly, in July 2022, the Joint Commission tasked with assessing DPI petitions appropriately found that there was no basis for granting a DPI, but that report was not finalized before the elections. As a result, industry is closely monitoring how the pending DPI will be addressed by the new government recognizing that the MoH could still act on this deeply flawed petition at any time, potentially destroying an entire market for a class of innovative medicines developed in the United States.

PhRMA urges USTR and other federal agencies to address this serious threat to American innovation through discussions under the U.S.-Colombia Trade Promotion Agreement. Industry is concerned about the increasing interest within the MoH to consider the use of compulsory licensing improperly, particularly when other options exist which would not compromise incentives for innovation. Experience and research demonstrates that compulsory licensing is not an effective way to improve access to medicines or achieve other public health objectives. It does not necessarily lower prices or speed access in the short-term, or provide sustainable and comprehensive solutions to longer-term challenges.

Regulatory Data Protection Failures

Existing Colombian legislation, Decree 2085 of 2002 (and its subsequent interpretation through a March 2003 joint act signed by the Ministers of Trade and Health), requires that new chemical entities receive a five-year period of regulatory data protection upon approval. Nevertheless, INVIMA is denying regulatory data protection upon approval of some new chemical entities, simply because they share a minor portion of their chemical structure with previously approved products.

This sudden and drastic change in procedure is inconsistent with the requirements of Decree 2085 of 2002 and contrary to the practice in other countries that provide regulatory data protection for such products. Such disregard of existing legislation undermines incentives to conduct clinical trials and develop new biopharmaceutical products in Colombia.

Restrictive Patentability Criteria

The Andean Court of Justice (ACJ) has issued several legal opinions (89-AI-2000, 01-AI-2001 and 34-AI-2001) holding that Andean Community members should not recognize patents for second uses. These decisions are contrary to long-standing precedents and inconsistent with TRIPS Article 27.1. Andean member countries, including Colombia, have chosen to honor their Andean Community obligations, while ignoring their TRIPS obligations.
The failure to provide patents for second uses harms patients by undermining incentives for biopharmaceutical innovators to invest in evaluating additional therapeutic benefits of known molecules (second uses) and provide more effective solutions for unsatisfied medical needs. The ACJ position is dispositive on the issue and no further domestic appeals or remedies are possible.

**Effective Patent Enforcement**

Despite having a specialized court under the auspices of the SIC designed to address IP infringement matters, Colombia needs to implement effective early resolution mechanisms that provide for the timely resolution of patent disputes before marketing approval is granted to infringing follow-on products during the patent term through increased collaboration between INVIMA and SIC.

**Market Access**

Numerous market access barriers have had a detrimental effect on patient access to innovative medicines in Colombia. Overall, 23 percent of new medicines launched globally since 2012 are available in Colombia, with Colombian patients waiting an average of 33 months from global first launch for the medicines that become available.\(^{242}\)

**Substandard Biologics Regulation**

On September 18, 2014, Colombia issued Decree 1782, which establishes marketing approval evaluation requirements for all biologic medicines. As part of the Decree, Colombia established an unprecedented “abbreviated” pathway for the registration of non-comparable products, which is inconsistent with WHO standards and practices in the United States and other countries, and which could result in the approval of medicines that are not adequately evaluated in terms of safety and efficacy. Since issuing the Decree, the MoH has issued implementing guidelines, but these guidelines have not served to resolve the fundamental deficiencies of the abbreviated pathway.

PhRMA members participated actively in the public consultations and engaged extensively with MoH and their technical experts, specifically highlighting that the abbreviated “third pathway” created by the Decree is not in line with the WHO guidelines for approval of biologics. In contrast to the Full Dossier Route (for originators) and the Comparability Pathway (pathway for Biosimilars) found in WHO guidelines, the “Abbreviated Comparability Pathway” as described in the Decree allows for summary approval of non-comparable products and does not provide adequate controls or any clarity regarding how the safety or efficacy of a product approved via this pathway will be evaluated and assured.

Furthermore, per the Decree, a product approved via the “Abbreviated Comparability Pathway” will use the same non-proprietary name as the innovator, even

---

though any similar biologic product would be a distinct biologic product from that of the originator or other biosimilar products. Assigning identical non-proprietary names to products that are not the same could result in inadvertent substitution of the products, generate a false sense of equivalence or substitutability and would make it difficult to quickly trace and attribute adverse events to the correct product. In addition, a product approved via the “Abbreviated Comparability Pathway” will receive approval of the same indications as the innovative product without demonstrating safety or efficacy.

Relatively, in May 2023, the Government issued the National Development Plan 2022-2026. Article 161 focuses on streamlining marketing authorizations for medicines, health devices and technologies, including expediting market entry of competing medicines (branded or generic). If the competing medicine requires bioequivalence and/or bioavailability studies as part of the pharmaceutical evaluation, they will be evaluated by an internal technical unit at INVIMA within three months. PhRMA and its member companies are concerned that this could result in unfair competition and approval of certain medicines that fail to meet international quality standards and international safety and efficacy requirements.

Cost-containment Measures Focused Exclusively on the Biopharmaceutical Industry

Government measures to improve the sustainability of the Colombian health system have focused solely on the biopharmaceutical industry and have not addressed broader issues within the pharmaceutical supply chain or other health care sectors. These measures have been developed in an arbitrary, hasty manner that leaves industry unable to plan for transitions. For example, in 2020, the Colombian Government issued Resolutions 205 and 206 to cap the expenditure of medicines not included in the publicly funded HBP. Most of these are innovative medicines, including products developed by PhRMA member companies. The budget caps set by the resolutions and the implementing regulations are based on historical spending, which by definition does not include more recent innovative medicines and are inadequate to ensure that Colombian patients have access to new treatments and cures.

The calculation of these budget caps has been strongly criticized by virtually all sectors of the health system and academia for technical limitations. These problems are aggravated in the methodology published for 2021, which set caps based on the historical minimum prices paid and atypical utilization volumes observed during 2020 because of the COVID-19 pandemic. As part of this calculation, the government publishes the estimated prices for each product according to the information reported by the government-sponsored HMO system (EPS), which may contain errors and does not provide opportunity for relevant stakeholders to verify the quality of the information. PhRMA and its member companies request that any cost containment measures consider the entire health care system, be developed and implemented through a participatory process with relevant stakeholders and include appropriate transition periods. In addition, MoH should consider alternative approaches to addressing uncertainty over spending, such as managed entry agreements.
Maximum Reimbursement Values

In 2019, the MoH established reimbursement caps (VMR) for more than one thousand products reimbursed by the government. The maximum reimbursement values correspond to the maximum cost that can be reclaimed from the Administrator of the Resources of the General System of Social Security in Health (ADRES) by EPS. Maximum values per unit for each active ingredient are calculated based on past reimbursement values during the reference period, adjusted for inflation. This formula skews toward lower prices by taking the 25th percentile of these values for multi-sourced products and the 10th percentile for single-sourced products. The reimbursement caps came into effect in May 2019 for 50 medicines and in January 2020 for the remaining group of medicines. These caps have reduced reimbursement across all impacted medicines (including single source, biologics and branded generics), by approximately 50 percent and plans for continued budget constraints are expected.

New Drug Price Regulation Methodology

In September 2023, the National Drug Pricing Commission (NDPC) published the draft circular adjusting the methodology for regulations in place since 2013. The NDPC is expected to make its system of IRP more restrictive by expanding the number of reference countries from 17 to 19 and changing the mix of countries to include those that are less supportive of innovation. Additional proposed changes include the use of a value-based pricing model based on therapeutic and economic assessments undertaken by the IETS.

PhRMA and its member companies have additional concerns about the proposed new price regulation draft methodology, including the frequency of price adjustments and a new cost containment mechanism that would adopt the lowest unit price observed domestically or internationally among groups of products that differ in strength, formulation, delivery system and quality. This approach fundamentally penalizes continued innovation that better meets diverse patient needs. Industry submitted technical comments to the NDPC highlighting these concerns. If the methodology is approved, it will be implemented starting in the first half of 2024.

Persistent Regulatory Barriers under the National Development Plan

Colombia’s 2014-2018 NDP, which was enacted in May 2015 as part of Law 1753, undermines gains Colombia has made to encourage innovation, delays patient access to cutting edge technologies and is inconsistent with Colombia’s international commitments. Specifically, Article 72 states that for certain identified drugs, including innovative medicines, an HTA by IETS and the setting of a price by the MoH based on that evaluation should both be prerequisites for marketing approval and renewal.

The MoH, following a warning from the Colombian Constitutional Court, implemented regulations for Article 72 that would separate INVIMA’s market approval processes from HTA and price control measures. However, the Council of State responded by issuing Decrees 433 and 710 of 2018, which partially and provisionally
suspended these regulations and again required new drugs to be assessed by IETS before INVIMA could issue a marketing approval: “IETS must carry out the assessment … simultaneously with the Sanitary Register process before INVIMA. The assessment carried out by IETS cannot be a condition for the granting of the Sanitary Register by that entity, which may issue it once its own assessment procedure is completed.”

The draft resolution, published in August 2023, on terms and conditions of the new regulation includes implementation of value-based pricing. Industry is concerned that this mechanism will be duplicative and further delay approvals for innovative drugs.

**Regulatory Decisions Inconsistent with Global Best Practices**

Products approved by reference authorities such as the U.S. Food and Drug Administration (FDA), the European Medicines Agency (EMA) are frequently either denied approval in Colombia or approved with deviations from their approvals in reference countries (e.g., approximately 80 percent of new medicines denied by INVIMA have been approved by the FDA and/or EMA). The data provided for these drugs is pharmacologically the same as provided to reference country authorities and no explanation is provided for why Colombia has reached a different outcome. These inconsistent outcomes underscore the need for ongoing collaboration between the MoH and INVIMA to ensure that the MoH adopts and applies regulatory assessment procedures and guidelines that are consistent with international best practices.

Moreover, Decree 677 of 1995 allows that, when a product has been approved in at least two reference countries and has not been rejected in any other reference country, the pharmacological evaluation will only consider a summary of the product’s clinical information. Despite this regulation, INVIMA in practice denies without justification the approval of innovative medicines that comply with these requirements, which blocks the entry of innovative medicines and ultimately increases trade barriers.

The Colombian American Chamber of Commerce engaged in stakeholder consultations with the Directorate General of INVIMA to address these concerns. During these consultations, INVIMA justified its practices citing insufficient understanding of abbreviated mechanisms and the FDA’s/EMA’s accelerated procedures for evaluating new molecules and a lack of confidence in the design of clinical trials. Industry remains concerned that INVIMA’s regulatory approach is inconsistent with global best practices.

**Arbitrary and Non-Transparent Pricing Policies**

Colombia sets a maximum price for both the public and private markets at the distributor level. These different channels are dissimilar in most characteristics, in that they serve different patient populations via different business models. In addition, the pricing system is highly subjective. For example, certain price control exceptions may be permitted for products with a significant technical benefit over medicines containing the same active ingredient (i.e., standard versus extended-release tablets), yet the criteria required to grant such exceptions are unclear.
EGYPT

PhRMA and its member companies remain concerned about the intellectual property (IP) and market access environment in Egypt. Despite Egypt undertaking major health care reforms to support universal health coverage and address significant unmet medical needs, the policy environment continues to pose challenges that the innovative biopharmaceutical industry seeks to improve. Egyptian Drug Authority (EDA) officials have expressed interest in supporting the innovative biopharmaceutical industry and encouraging investment in the country. Recently, EDA adopted an open and flexible approach to support individual companies in alleviating some of the losses due to the devaluation of the Egyptian pound via repricing policies. PhRMA encourages both EDA and the Egyptian Authority for Unified Procurement, Medical Supplies and the Management of Medical Technology (UPA) to continue engaging with industry before developing, changing or finalizing new policies. PhRMA also looks forward to working with the Egyptian Government to implement the recently launched high-level Egyptian IP Strategy to promote innovation consistent with international best practices.

Key Issues of Concern:

- **Weak patent enforcement and compulsory licensing threats:** Egypt lacks effective patent enforcement, enabling manufacturers to obtain marketing licenses for follow-on products prior to the expiration of the patent on the original product. Also, in 2020, the Egyptian Government established a ministerial committee with broad discretion to issue compulsory licenses.

- **Government pricing, reimbursement and procurement:** While Egypt has significantly improved registration and pricing timelines, the Egyptian Government continues to implement an international reference pricing (IRP) regulation that limits and delays patient access to innovative medicines. In addition, the UPA government procurement processes lack transparent criteria, contracting terms and timelines that further hinder the ability of PhRMA member companies to plan and invest in bringing new medicines to the market. UPA is also currently planning to implement a new health technology assessment (HTA) system to inform pricing and reimbursement decisions, but important details have not been announced.

- **Clinical trials:** While Egypt has improved its framework for clinical trials in country by better aligning with international standards, the process for approvals remains uncertain and confusing.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

---

Intellectual Property Protection

Egypt announced a National IP Strategy in 2022, which includes high level national goals and targets to reform its legislative and institutional IP frameworks. The IP strategy is set to take place over five years. Pursuant the IP Strategy, the Egyptian House of Representatives approved in June 2023 a law to establish the Egyptian Agency for Intellectual Property Rights (EGIPA). The EGIPA is not yet operational, but is mandated to supervise and manage all forms of IP in Egypt.

Weak Patent Enforcement

Despite recognizing the value of protecting biopharmaceutical innovations through its patent system, Egypt does not provide an effective mechanism to ensure that follow-on marketing licenses are not granted to companies making products that potentially infringe on an originator’s patent. Egyptian officials need to put in place an effective patent enforcement system similar to the process used by the United States or in other neighboring countries. The newly established EGIPA should prioritize addressing effective patent enforcement in Egypt.

In neighboring countries, regulators who receive a marketing application from a generics company are required to check for any existing patents applying to the reference drug. Egypt should seek to provide innovators transparent and effective early dispute resolution mechanisms to avoid the marketing authorization of possible patent infringing products. At a minimum, the EGIPA should oversee an early dispute resolution mechanism that (1) provides notification to right holders when third parties apply for marketing approval of generic or biosimilar versions of medicines; (2) enables the holder of a patent on a biopharmaceutical product to seek provisional enforcement measures, such as a stay, preliminary injunction or interlocutory injunction, to prevent the marketing of a potentially infringing generic or biosimilar version of that product; and (3) provides for the timely resolution of patent disputes before an infringing follow-on product is allowed to launch on the market.

Compulsory Licensing Decree No. 251/2020

In early February 2020, the Prime Minister issued Decree No. 251/2020 forming the Ministerial Committee stipulated in Article 23 of the Law with the authority to compulsory license or expropriate any patented product or process. The Decree and Egypt’s Patent Law (Law no. 82/2002) give the committee broad discretion to take patents. The votes of only three of the five members of the committee are necessary to issue a compulsory license (CL).

The fact that the Government of Egypt established a ministerial committee nearly two decades after the Patent Law entered into force – and without any prior notification to or engagement with the private sector – sent an alarming signal to the companies we represent and to many other innovative industries.
Experience and research demonstrate that compulsory licensing is not an effective way to improve access or achieve other public health objectives. It does not necessarily lower prices or speed access in the short-term or provide sustainable or comprehensive solutions to longer-term challenges. It does not address systemic barriers to access – from weak health care delivery systems to low national health care funding and high taxes and tariffs on medicines. Compulsory licensing is particularly ineffective relative to the many alternatives available, such as voluntary licensing. Biopharmaceutical innovators support different tools and programs that make medicines available to patients who could not otherwise afford them.

PhRMA believes governments should grant CLs in accordance with international rules and only in exceptional circumstances and as a last resort. Decisions should be made through fair and transparent processes that involve participation by all stakeholders and consider all relevant facts and options.

**Market Access**

**Government Pricing and Reimbursement**

Through Pricing Decree No. 499/2012, EDA continues to implement IRP, which limits and delays access to innovative medicines. Only 21 percent of new medicines launched globally since 2012 are available in Egypt, with Egyptian patients waiting an average of 39 months from global first launch for the new medicines that become available. Although some progress has been made, PhRMA and its member companies remain concerned that Egypt has yet to systematically address the drawbacks of its current pricing system, including by establishing a method to adjust for exchange rate fluctuations and address concerns regarding the basket of reference countries and the formula used to set prices. Ultimately, the current policies are incompatible with the country’s goal of establishing a value-based health care system. Industry seeks to work with EDA to resolve the challenges of Pricing Decree No. 499/2012, put a hold on the implementation of any new pricing mechanism not required by an existing national law or decree, and transition toward a value-based pricing and reimbursement system.

**Government Procurement**

Established in 2019, the UPA is the government authority responsible for national procurement, tendering, medical supplies and HTA. The UPA aims to accelerate access to medicine through value-based procurement and reimbursement methodologies, but it currently lacks required capabilities and policies. As a result, PhRMA member companies face many challenges regarding government procurement of medicines. Frequent price renegotiations have limited predictability and fair competition, and the lack of transparent criteria, contracting terms and timelines for the procurement process have hindered the ability of companies to plan and invest in bringing new medicines to market. Clarity and predictability in the mechanisms for tendering price adjustments would provide patients

---

greater access to innovative medicines. Unfortunately, the UPA continues to prioritize cost containment over quality when procuring drugs for public institutions. Finally, contrary to current practice, UPA should not disclose confidential negotiated net prices, as doing so harms competition and access to innovation.

Clinical Trials

PhRMA and its member companies are encouraged by EDA’s commitment to support clinical trials in Egypt, announcing that all clinical trials in country will be in line with the principles of international best practices in conjunction with EDA-supported training sessions for trial sponsors. However, the process and timeline for clinical trial approval remains undefined, prolonged and opaque. PhRMA submitted an industry compiled document of best practices to the MoH, highlighting these issues and requesting enhanced coordination.
EUROPEAN UNION

PhRMA and its member companies are concerned by the direction of the European Commission’s (EC’s) proposals to revise the EU’s general pharmaceutical legislation (Pharma Package). These proposals would weaken IP rights and increase legal uncertainty in one of the world’s largest markets. In April 2023, the EC issued a number of legislative proposals that would reduce the regulatory data protection (RDP) term in Europe by two years. Separately, the recently-proposed EC Patent Package would establish an unprecedented and impermissible pan-EU compulsory licensing mechanism and create redundant and unnecessary opportunities for third parties to oppose supplementary patent certificates (SPCs). In addition, PhRMA member companies face a variety of national cost-containment policies across Europe that jeopardize incentives for biopharmaceutical innovation and patient access to innovative medicines. As a result of Europe’s on-going economic challenges, several EU and European Free Trade Association (EFTA) Member States continue to seek additional cost savings at the expense of the innovative biopharmaceutical sector, thereby not carrying their fair share of costs to research and develop new medicines, as well as undermining U.S. biopharmaceutical competitiveness.

Key Issues of Concern:

- **EU Pharma and Patent Packages:** The EU’s Member States in 2016 tasked the EC with reviewing and assessing current EU legislative instruments and related incentives. The legislative proposals that derived from this exercise, published in 2023, would weaken existing incentives, including RDP, research exemption mechanisms and incentives related to medicinal products to treat rare diseases. The proposals introduce the concept of conditioning IP incentives on product launches in all EU member states within two years of obtaining an EU marketing authorization. That conditionality is wholly outside of the control of innovator biopharmaceutical manufacturers. In parallel, the EC’s Patent Package seeks to create an unnecessary pan-EU CL mechanism that is contrary to the EU’s commitments under the World Trade Organization Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) and would establish a new mechanism for third parties to oppose SPCs. These proposals follow concerning amendments in 2019 introducing an export and stockpiling waiver to SPCs for medicinal products. The SPC manufacturing waiver reduces the scope of the exclusive rights conferred by an SPC and undermines the EU’s commitment to IP incentives and innovation.

- **Government price controls and patient access to innovative medicines:** Among numerous government price controls in effect, many EU and EFTA Member States set prices of patent-protected innovative medicines based on policies that restrict availability, limit patient access and fail to recognize the value of state-of-the-art medicines for patients and societies. Some examples include regulations that set prices based on the prices in less wealthy countries or in countries with policies that do not support innovation and based on the prices of
older and less innovative products deemed to be comparable, including generics. These and other government practices, coupled with rigid health technology assessment (HTA) interpretations of value, put at risk biopharmaceutical innovation and seriously harm patient access to needed medicines. As such policies and regulations continue to ratchet European prices lower, there are increased calls for cross-border sharing of confidential price information that undermines the ability to adapt to the different needs of each country. Furthermore, although EU legislation requires transparent and timely processes (e.g., within 180 days) for national pricing and reimbursement decisions, delays for medicines launched in Europe average 517 days and are particularly significant in some European countries. Eighty-five percent of new medicines launched globally since 2012 are available in the United States compared to just 41 percent in EU Member States, on average. These requirements for transparent and timely processes need to be enforced more rigorously across Europe and with broader oversight of national practices.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**EU Pharmaceutical Strategy**

In June 2016, the European Member State Health Ministers requested the EC to undertake a review of existing IP-related incentives for the biopharmaceutical industry to gauge their effectiveness and impact on innovation and the availability, accessibility and affordability of medicines. The EC undertook a review process which concerns the following pieces of legislation: SPCs (Regulation EC 469/2009), Medicinal products for human use (Directive 2001/83/EC and Regulation EC 726/2004), Orphan medicinal products (Regulation EC 141/2000) and Pediatrics (Regulation EC 1901/2006).

In April 2023, the EC released a number of legislative proposals that would undermine core elements of the EU’s IP regime. First, the EC proposed a number of revisions to Directive 2001/83/EC and Regulation EC 726/2004 that would reduce RDP terms in the EU by two years with illusory opportunities to restore those lost years of protection if the medicinal product is “released and continuously supplied” to all member states within two years of EMA marketing authorization. This condition is outside of the

---

control of the innovator given that market launch in each member state depends on timely pricing and reimbursement determinations, when many member states routinely fail to meet the procedural timelines set forth in the Transparency Directive (Directive 89/105/EEC). As such, the proposed legislation is a significant diminution of the RDP term in the EU. In addition, the EC is proposing to reduce the orphan market exclusivity (OME) for rare disease medicines and expand the EU’s Bolar exemption to include the conduct of studies and trials and other activities needed not only for the marketing authorization but also for an application for a HTA and pricing and reimbursement. Industry is highly concerned that this definition may further undermine effective patent enforcement in the EU given that listing on pricing formularies is currently the trigger in many countries for seeking injunctive relief (clear indication that the follow-on product is threatening to infringe the innovator’s patent).

Similarly, PhRMA has serious concerns with the EC’s proposed regulation (COM(2023)224) to establish a pan-EU compulsory licensing (CL) mechanism for “crisis” management.249 Although most respondents during the consultation process supported a coordinating role only for the EU institutions related to CLs, the proposed regulation goes significantly further. At a time when IP rights are being opportunistically challenged by certain countries – often to support their own industrial policy goals – this unjustified, unprecedented and impermissible proposal to create another CL mechanism in the EU is incredibly counterproductive. Separate from the question of the EC’s competency to implement a pan-EU CL that would override patents granted at the member state level (the proposal is not even limited to unitary patents), the proposed regulation is inconsistent with the WTO TRIPS Agreement. Specific concerns include that the proposal fails to consider CLs on their individual merits, disregards the value of voluntary negotiations prior to granting a CL, lacks appropriate judicial review and imposes a four percent royalty cap, contrary to the TRIPS requirement (Article 31(h)) that the right holder “be paid adequate remuneration in the circumstances of each case, taking into account the economic value of the authorization.” Further, the proposed regulation includes provisions that would extend the CL to cover other “measures complementing the [CL], which are necessary to achieve the objective of the [CL].” While not defined, “other measures” is broad enough that it could implicate other IP rights, including measures that would be inconsistent with the EU’s obligations to protect trade secrets and regulatory data under TRIPS Art. 39.

The COVID-19 pandemic has shown how voluntary arrangements between innovators and other manufacturers enabled rapid responses to produce and distribute medical countermeasures. Now, more than ever, instituting new mechanisms to facilitate CLs would irreversibly damage innovation policies worldwide and undermine critical incentives needed to prepare for future crises.

Finally, PhRMA has significant concerns with the EC’s proposal (COM(2023)231) to establish a new mechanism for parties to oppose the grant of SPCs. While PhRMA supports the general intent of the proposed recast of the SPC Regulation to establish a centralized process for seeking SPCs in the EU without altering the substance of that protection, the proposed procedure includes redundant and unnecessary opportunities for third parties to oppose SPCs before they are even granted. These mechanisms are in addition to the ability to submit observations, appeal an SPC decision to the Board of Appeals and, in turn, the General Court of the European Union, as well as to contest the validity of the underlying basic patent and the SPC. While SPCs are fundamentally important in terms of restoring a portion of the effective patent term lost due to the lengthy development and regulatory approval process for new medicines, the determination of whether an application for an SPC meets the criteria and procedural requirements as set forth in the SPC Regulation does not require an opposition mechanism. Whereas Article 19(2) of the current SPC Regulation No. 469/2009 expressly excludes oppositions from the process of granting an SPC, the proposed recast takes the opposite approach without any explanation and despite the fact that most SPCs are not contested. SPC applications do not require nor merit the level of scrutiny proposed in the recast Regulation.

Market Access

Government Price Controls and Patient Access to Innovative Medicines

As detailed further below, many EU countries engage in government pricing and reimbursement practices that restrict availability, limit patient access and fail to recognize the value of state-of-the-art medicines for patients and societies. Moreover, since the U.S. research-based industry is the world leader in the development of new medicines, PhRMA member companies and their innovative products disproportionately bear the brunt of these measures as they undermine the financial incentives for privately sponsored R&D. Not only does this threaten the development of new treatments and cures, it also directly threatens the competitiveness of the U.S. biopharmaceutical industry and its workers. Furthermore, although EU legislation requires transparent and timely processes (e.g., within 180 days) for national pricing and reimbursement decisions, delays for medicines launched in Europe average 517 days and are particularly significant in some European countries. Eighty-five percent of new medicines launched globally since 2012 are available in the United States compared to just 41 percent in EU Member States, on average. These requirements for transparent and timely processes need to be enforced more rigorously across Europe and broader oversight of national and subnational practices should be in place.

---

Austria

Since 2017, Austria has adopted a spate of new cost-containment measures. Despite being one of the wealthiest countries in Europe, Austria sets relatively low prices on new medicines and imposes controls on utilization. Specifically, Austria sets a ceiling price for reimbursed new medicines based at or below the average price across all EU countries in the retail sector. In addition, Austria sets reimbursement conditions for new medicines using a traffic light colored box system: medicines in the red box are restricted while awaiting a reimbursement decision; medicines in the yellow box face prescribing restrictions as a condition of reimbursement; medicines in the green box are automatically allowed to be a prescriber’s first choice but face additional automatic price cuts via therapeutic class reference pricing. Medicines in neither box face a reduction of 6.5 percent versus the EU average price if the ex-factory revenue exceeds €750,000 within 12 months. Although patients in hospitals can access medicines immediately after approval, pilots are ongoing to evaluate the use of an HTA process for the hospital sector. In practice, medicines reimbursed by the statutory social insurance system, as well as in the hospital sector, are subject to additional significant rebates during the patent term and price cuts when off-patent. Moreover, after the manufacturer’s sales price is set, a review of the average EU price and resulting Austria reimbursement price occurs on a regular basis. Industry has grown increasingly concerned about the unilateral nature of these measures, which were made without meaningful opportunity for engagement. Overall, just 56 percent of new medicines launched globally since 2012 are available in Austria, with Austrian patients waiting an average of 12 months after global first launch for the medicines that become available.\textsuperscript{253}

Belgium

The Belgian Government sets maximum prices for all reimbursed prescription medicines and uses several cost-containment measures that impact innovative medicines. For example, a turnover tax (7.73 percent) and marketing tax (0.13 percent) are applied to sales of reimbursed medicines. For orphan medicines, the turnover tax ranges from zero to five percent depending on the turnover. In addition, when the government’s medicines budget is exceeded, manufacturer revenues are clawed back through a subsidiary tax of up to four percent of the medicines budget. Only 41 percent of new medicines launched globally since 2012 have launched in Belgium, with Belgian patients waiting an average of 23 months after global first launch for the medicines that become available.\textsuperscript{254}

Czech Republic

While the Czech Government has increased investment in health care and expanded access to innovative medicines, the country’s pharmaceutical share of total health spending has declined considerably in the past decade from 26 percent in 2010 to

\textsuperscript{253} Id.
\textsuperscript{254} Id.
19 percent in 2021 due to rigid cost-containment regulations such as its “double referencing” system.\textsuperscript{255} Under this system, the price of a new medicine cannot exceed the average price of the lowest three countries among 19 EU countries. In addition, in most cases, the reimbursed price is set at the lowest EU price of a therapeutic cluster of medicines, which can combine patented, off-patent and generic medicines.\textsuperscript{256} In addition, innovative medicines in the Czech Republic are subject to non-transparent and lengthy reimbursement processes that reduce patient access. Only 42 percent of new medicines launched globally since 2012 have launched in the Czech Republic, with Czech patients waiting an average of 22 months after global first launch for the medicines that become available.\textsuperscript{257} The target timeline for pricing decisions is 75 days from receipt of an application and 165 days for joint pricing and reimbursement decisions. In practice, decisions take more than a year on average. In addition, broader usage of innovative medicines is often limited by volume caps imposed by managed entry agreements for new medicines and/or indications.

One additional provision of the Czech health care legislation that could represent a significant threat to PhRMA member companies is the mandatory delivery of medicinal products to wholesalers based on their market share, which imposes inappropriate limits on a manufacturer’s freedom to select and contract with specific wholesalers and introduces obstacles to entering the market.

**Denmark**

Although Danish law does not directly regulate prices, the government decides which medicines are reimbursed and in effect sets prices through an agreement with the local innovative pharmaceutical industry association that requires international reference pricing, price caps, tendering and other cost-containment measures. In effect, the prices of medicines have been capped since 2006.\textsuperscript{258} HTAs conducted by the Danish Medicines Council apply overly conservative approaches to evidence standards and sometimes reject reimbursement applications over concerns that the medicines might be used outside of the target patient population. Further, the Council’s conservative approach affects the evaluation and approval of new cell and gene therapies, to which Danish patients have much worse access than in neighboring countries, such as Sweden and the United Kingdom.\textsuperscript{259} Manufacturers also face pricing competition from parallel imports across Europe, which comprise approximately 13 percent of the Danish overall market for medicines, and which are eligible for hospital tenders. Overall, these practices have created uncertainty for biopharmaceutical innovators and patient access. Only 53 percent of new medicines launched globally since 2012 have launched in Denmark, with Danish

\textsuperscript{255} State Institute for Drug Control (SUKL), World Health Organization (WHO), Fitch Solutions.

\textsuperscript{256} Id.

patients waiting an average of 12 months after global first launch for the medicines that become available.260

Finland

The Finnish pricing and reimbursement environment is both restrictive and lacks support for innovative medicines. Initially, nearly all new products are granted only basic reimbursement status (including innovative therapies for serious conditions, such as new cancer therapies and orphan drugs), leaving patients to cover 60 percent of costs. For chronic and/or severe illnesses there is a possibility for greater coverage that leaves patients to cover between zero percent and 35 percent of costs. Manufacturers seeking greater coverage must apply for special reimbursement status through a lengthy, complex and non-transparent process where there is little dialogue with manufacturers. In addition, manufacturers must submit information on wholesale prices and reimbursement status in European Economic Area (EEA) countries since Finland includes all EEA countries in its international reference pricing system, with reports indicating that Finland’s drug prices are at the lower end of EEA countries.261 New medicines in Finland also undergo frequent reimbursement reviews, with the first approved price valid for less than two years. Although a risk-sharing system established in 2017 has improved reimbursed access, cost-containment measures over the past 15 years have brought the country’s pharmaceutical spending as a percentage of total health spend well below the OECD average. Only 48 percent of new medicines launched globally since 2012 have launched in Finland, with Finnish patients waiting an average of 15 months after global first launch for the medicines that become available.262

France

Characterized by a notoriously slow market access process, France heavily regulates the price of new innovative medicines and has established since 2004 annual plans of budget savings through price cuts, including a goal of saving €900 million in 2023 through price cuts alone. Over time, France has adopted several policies that negatively impact the biopharmaceutical industry, including layered mechanisms such as taxes, price-volume clauses that trigger price cuts, traditional rebates and an industry-wide clawback when national spending growth on reimbursed medicines exceeds a target level specified by the government each year. These industry payback schemes were intended to be limited to €200 million in 2023, for a cumulative €1.1 billion contribution from the biopharmaceutical industry, but they could grow much larger.263

Additionally, there are serious challenges with France’s HTA system, which rates the clinical added value of a product as major (ASMR I), important, (ASMR II), moderate

(ASMR III), minor (ASMR IV) or no clinical improvement (ASMR V), with corresponding impacts on pricing. In practice, few innovative medicines are assigned ASMR ratings of I, II or III, which means that health authorities deem most new innovative medicines as providing only a minor or no clinical improvement. However, for certain products that treat severe or rare diseases and that have not yet received European marketing authorization, this delay in market access can be moderated through the French Early Access Program, formerly known as Temporary Use Authorization (ATU) process. Only 52 percent of new medicines launched globally since 2012 have launched in France, with French patients waiting an average of 20 months after global first launch for the medicines that become available.264

However, there have been some important positive signals to the innovative biopharmaceutical sector. A new agreement signed in March 2021 between the local innovative pharmaceutical industry association, Les Entreprises du Médicament (LEEM), and the French Government aims to reduce market access delays and promote investment for innovative products. During the CSIS265 in 2021, President Macron announced that a pilot program for accelerated access would be implemented in 2022; however, it has been delayed. In this new system, products rated with ASMR I to IV would be available on the market following the HTA and during price negotiations. Recently, the ATU process was replaced by two fast tracks: the primary one, the “accès précoce,” process is intended for innovative products prior to marketing authorization, and “accès compassionnel” for specific patient populations or physician-prescribed off-label use. Nevertheless, the medicines budget remains challenging and the impact of the new measures on patient access are yet to be seen. Market growth has been mostly flat since 2009, and lower than in peer countries as the French Government seeks budget savings from medicines to preserve social security finances.

**Germany**

Germany’s Pharmaceutical Market Restructuring Act (AMNOG) of 2011 restructured its pricing and reimbursement process away from market-based pricing toward a government-managed and payer-led system of clinical evaluation and price-setting. Under AMNOG, the Federal Joint Committee (G-BA) oversees a rigid early clinical benefit assessment and subsequent price negotiations with the umbrella organization of the German payers (i.e., Statutory Health Insurances) that are tied to the outcome of the G-BA assessment. The prices of products deemed not to provide considerable or major clinical benefits are generally set at or below the price of the comparator determined by the G-BA. Lowest-cost comparators and generics are often considered by the G-BA to be appropriate comparators; however, research shows that scientific medical societies, in more than 50 percent of cases, oppose the comparator

265 CSIS: Conseil stratégique des industries de santé is a meeting organised by French government with global CEOs of pharmaceutical companies.
selected because it was clinically inappropriate. In addition, Germany has implemented a price freeze on reimbursed medicines since 2009 (now extended through 2026) that has reduced the comparator prices used to set the prices of many new medicines.

One of the chief complaints with the AMNOG procedure concerns the strict requirements on the types of study designs and clinical endpoints that are admissible for demonstrating proof of additional clinical benefit as well as determining comparator therapies. These rigid assessment requirements have contributed to the G-BA concluding in 61 percent of assessments that an innovative medicine demonstrates no additional clinical benefit in the specified patient subpopulation. When accounting for the varying sizes of the specified patient subpopulations, the G-BA has deemed innovative medicines to have no additional benefit for 72 percent of potential patients and a considerable or major benefit for less than 8 percent of potential patients. In contrast, many of these treatments have been widely recognized as important and even breakthrough therapies in the United States and other countries. G-BA benefit assessments not only affect the availability of medicines (only 61 percent of new medicines launched globally since 2012 are available in Germany compared to 85 percent in the United States), but they can heavily influence physicians’ ability to prescribe new medicines to patients without repercussions. Although Germany has the highest share of newly launched medicines among EU countries, it has become less likely to be the country of first European launch since AMNOG was implemented in 2011. Prior to AMNOG, roughly one in ten new medicines launched in Europe were launched in another European country before Germany; since AMNOG, that ratio has grown to one in four.

In 2022, the Statutory Health Insurance (SHI) Financial Stabilization Act went into effect, shifting the AMNOG process from a negotiation-based methodology toward an algorithm-based one. The Act shortens the period of free pricing (when manufacturers can set prices prior to the G-BA assessment) from 12 months to six months, and introduces “guardrails” leading to lower prices than comparators for most new medicines assessed. In addition, the Act lowers the annual sales threshold (from €50 million to €30 million) to exempt orphan drugs from the AMNOG process, raising concerns that patient access could be negatively impacted; imposes a 20 percent rebate on the reimbursement amount for patent-protected products used in combinations; and increases the mandatory rebate on medicines from seven to 12 percent. A recent study shows that the Act restricts patient access to medicines and decreases the attractiveness

271 The “guardrails” apply when the comparator is also patent-protected.
of Germany as an innovative hub for the biopharmaceutical industry.\(^{272}\) Recently, the German Government announced its intention to adopt a dedicated strategy for strengthening Germany as a pharmaceutical location.\(^{273}\)

**Greece**

PhRMA and its member companies are concerned about excessive and growing mandatory clawbacks and rebates in Greece, which undermine innovation and delay patient access to new medicines. In 2022, the total industry amount for clawbacks and rebates (€2.8 billion) exceeded total public spending on medicines (€2.6 billion). Only 40 percent of new medicines launched globally since 2012 have launched in Greece, with patients waiting an average of 22 months after global first launch for the medicines that become available.\(^{274}\)

Greece’s biopharmaceutical environment remains among the most challenging in Europe, due especially to drastic reductions in public spending on medicines alongside growing clawbacks and rebates required from industry. The public budget for medicines declined by 58 percent between 2009 and 2015 (from €5.9 billion to €2.5 billion).\(^{275}\) Since 2015, the public budget for medicines has remained flat (increasing only €0.1 billion from 2015 to 2022) while the industry amount for clawbacks and rebates grew from less than €0.5 billion to €2.8 billion. Essentially, all of the growth in Greece’s biopharmaceuticals market over the past seven years has been paid for by industry clawbacks and rebates. The Greek government introduced industry offsets that reduce clawbacks and rebates for some companies; however, the mechanism is designed such that only domestic companies are eligible, thereby shifting more of the growing burden of clawbacks and rebates to U.S. and other non-domestic companies.\(^{276}\)

**Hungary**

Government pricing and reimbursement of medicines in Hungary has been under substantial pressure since the Pharma Economic Act of 2007 and the two Széll Kálmán austerity plans. Following the financial crisis, the biopharmaceutical budget was frozen, only returning to pre-crisis levels, in real terms, in 2018. However, Hungary is capping the prices for new products in Hungary to the lowest price at launch in any EU country.

\(^{274}\) Id.

Hungary also engages in a “blind bidding system” for therapeutic reference pricing groups which can be comprised of both patented medicines that have been marketed for at least one year and off-patent medicines. The system requires manufacturers to submit “blind” price reductions to the National Health Insurance Fund of Hungary (NEAK) every six months. Only 36 percent of new medicines launched globally since 2012 have launched in Hungary, with Hungarian patients waiting an average of 23 months after global first launch for the medicines that become available.

In late 2020, the Hungarian Government granted a compulsory license (CL) on a COVID-19 treatment conditionally approved by the EMA, citing newly promulgated emergency Law Decrees 283/2020 and 478/2020. This action was unnecessary as Hungary continues to have full access to the medicine via the EC’s Joint Procurement Agreement (JPA) with the patent holder and continues to use it to meet its national needs. Throughout this process, the Hungarian Government did not contact the patentee to suggest that a CL was needed, and the CL was granted with only a day’s notice to the patentee. The CL action was challenged in the national court system, which ruled that the patentee did not have standing to challenge the grant of the CL per se, making it impossible to challenge the grant of any CL in Hungary. This approach of the Hungarian courts raises significant rule of law concerns and damages the environment for investment and ease of doing business in an EU member state. PhRMA and its members believe that this CL is unnecessary and unwarranted, and runs counter to the EC’s IP Action Plan, which states that CLs can only “be used as a means of last resort and a safety net, when all other efforts to make IP available have failed.”

In April 2022, the Hungarian Government instituted an increased clawback requirement whereby the clawback is raised from 20 to 28 percent for drugs having an ex-factory price (MSP) higher than 10,000 HUF. In June 2023, the 28 percent clawback rate was further raised to 40 percent for drugs having an MSP higher than 10,000 HUF. In 2023, the Hungarian Government also introduced a policy allowing manufacturers to reduce their clawback payments by up to 50 percent, based on the value of their investment and R&D expenditures in Hungary.

Ireland

Ireland’s biopharmaceutical industry is among the Irish economy’s strongest performers, with robust growth in exports of pharmaceutical products contributing positively to gross domestic product (GDP). However, Ireland continues to lag many other European countries when it comes to availability of new medicines. Only 35 percent of new medicines launched globally since 2012 have launched in Ireland, with patients waiting an average of 21 months after global first launch for the medicines that become available. Promisingly, a four-year Framework Agreement on the Supply and Pricing

---

279 Id.
of Medicines between the Irish Government and the Irish Pharmaceutical Healthcare Association (IPHA) was agreed in 2021. Government budgets over 2021-23 have allocated nearly €100m for new medicines and over 100 new products or line extensions of IPHA members have been added to State reimbursement. However, the process to assess and reimburse new medicines is excessively slow and can take nearly a year after completion of a HTA or Rapid Review to commence reimbursement and become available to patients. The IPHA has proposed several steps, including early access procedures, and in March the Minister for Health set up a first-ever internal working group aimed at making the reimbursement process more efficient. The 2024 Budget, to be announced in October 2023, will signal the government’s intention on funding, including the results from the working group. PhRMA urges the U.S. Government to engage with its counterparts in the Irish Government on achieving and sustaining patient access to innovative medicines through a combination of process reforms and continued annual funding commitments.

Italy

PhRMA and its member companies are concerned about industry revenue clawbacks and other cost-containment measures for innovative medicines in Italy. Only 52 percent of new medicines launched globally since 2012 have launched in Italy, with Italian patients waiting an average of 20 months after global first launch for the medicines that become available. And, patients wait an additional 18 months, on average, for new medicines to be publicly reimbursed, even longer in some regions.280

Industry revenue clawbacks are triggered in Italy when public spending exceeds the significantly underfunded public budget. There is currently an overall budget shortfall of €2.4 billion for medicines that is made worse by a suboptimal allocation of the budget across the retail channel and the hospital / direct purchasing channel. In 2023, there is a budget surplus in the retail channel (€750 million) and a budget deficit (€3.1 billion) in the hospital / direct purchasing channel. But, according to the clawback rules, it is not possible to compensate a deficit in one channel with a surplus in the other channel; companies operating in the hospital / direct purchasing channel will be required to refund 50 percent of the €3.1 billion budget deficit. Given that more innovative products are in the hospital / direct purchasing channel, the unbalanced clawback rules disproportionately penalize U.S. innovative biopharmaceutical companies, which have so far paid 41 percent of the cumulative €3.8 billion in clawbacks from 2019 to 2021 even though they only account for 30 percent of sales. According to a recent study, 98 percent of the clawback has been paid by non-domestic companies.281 Some improvements were introduced in the 2021 and 2022 Budget Law that shifted budget to the hospital / direct purchase channel (€1.2 billion per year). This is a positive development; however, a more adequate and proportional financing of the two budget allocations is still necessary. Industry requests

280 Id.
that the Italian Government increase the overall National Healthcare Fund and adjust the allocation of the pharmaceutical budget between the two channels.

In addition to clawbacks, other policies present challenges for innovation and patient access to medicines. For example, the Italian Drug Agency (AIFA) can establish (without using shared and agreed scientific criteria) therapeutic equivalence between patented drugs and other patented drugs or generics with different active ingredients when determining comparators. Further, AIFA can re-open pricing and reimbursement negotiations for review prior to the conclusion of the agreement.

The Netherlands

PhRMA and its member companies are concerned about the rising interest in the Netherlands regarding the use of compulsory licensing as a way to lower spending on medicines. In 2019, the government commissioned an academia-led compulsory licensing committee to examine legal and economic issues related to the use of compulsory licensing. In June 2020, the commission completed its work, unable to reach a joint conclusion. The Ministry of Economic Affairs took note of the commission’s work and concluded that the existing legal framework was sufficient. However, some legislators have refocused discussions on compulsory licensing around COVID-19 related technologies, including both vaccines and therapies. PhRMA believes that future discussions about compulsory licensing need to consider the devastating effects on innovation and the R&D environment more generally. PhRMA welcomes the Prime Minister’s statements making clear the government’s position that compulsory licensing would not improve access to COVID-19 technologies and that the Ministry of Economic Affairs remains strongly opposed to any form of compulsory licensing.

The Netherlands has also intensified cost-containment measures on innovative medicines. For example, the government began a pilot program in 2015 that places innovative medicines into a reimbursement “lock” system that denies patient access until completion of a HTA and subsequent price negotiations. The Netherlands initially implemented this system on a case-by-case basis but announced in May 2018 that it would apply to all new medicines with an annual cost exceeding €50,000 per patient (when combined costs exceed €10 million) or a combined cost of €40 million. Further expansion of the “lock” system is planned to include all hospital medicines with an annual budget impact of €10 million or more. Decision making criteria lack transparency and there is no time limit on the lock period, currently estimated to be 380 days.

The government also plans in 2024 to further erode the prices of innovative retail medicines deemed by the Ministry of Health, Welfare and Sport to be therapeutically interchangeable by recalculating reimbursement limits to not exceed the average price of a therapeutic group, which can include off-patent medicines and generics. Beginning in 2020, all medicines were subject to an updated international reference pricing system

---

that replaced Germany with Norway, where prices are an average of nine to 13 percent lower than those in the Netherlands. This change was delayed from April to October 2020. It is estimated this change will reduce prices in the Netherlands by five to 10 percent and reduce annual spending on medicines by around €300 million. In addition to facing these cost-containment measures, most new medicines in the Netherlands are required to navigate a complex path from regulatory approval to reimbursement formulary listing that takes 328 days to complete on average. Recognizing this challenge, the Medicines Evaluation Board and the Dutch National Healthcare Institute began a pilot in collaboration with industry to reduce reimbursement delays. In September 2022, an Integral Healthcare Agreement was signed by various health care stakeholders. The high-level Agreement referred to several of the above mechanisms, but the biopharmaceutical sector was not included in any stage of the process. Only 45 percent of new medicines launched globally since 2012 have launched in the Netherlands, with Dutch patients waiting an average of 19 months for the medicines that become available.

**Norway**

Despite its considerable wealth and universal health coverage, Norway has one of the lowest levels of spending on medicines as a share of total health care spending in Europe (eight percent in 2019 compared to an average of 15 percent for Europe). Through the national centralized procurement agency of the Norwegian Government, four regional health authorities establish pharmaceutical formularies and conduct price negotiations and purchases. This agency determines the maximum price of new medicines based on the average of the three lowest prices in a basket of nine European countries. Additionally, Norway obtains substantial price discounts on some innovative medicines through its centralized procurement process, which uses therapeutic tenders that often include older medicines and generics. Over the last year, there have been concerning disclosures of PhRMA member company confidential net prices. While the Norwegian Government maintains that these disclosures were unintentional, repeated disclosures indicate weak safeguarding of trade secrets, thus becoming a barrier to fair competition in the Norwegian market. Only 55 percent of new medicines launched globally since 2012 have launched in Norway, with Norwegian patients waiting an average of 13 months for the medicines that become available.

**Poland**

Poland caps the share of public spending on medicines using industry clawbacks; however, the share of National Health Fund spending on medicines has always remained relatively stable and under the 17 percent ceiling at which point industry clawbacks are

---

mandated. In 2021, the Polish Government drafted an amendment to increase industry clawbacks above the cap from 50 to 100 percent and remove exemptions from the cap for risk-sharing schemes, but industry successfully pushed back on this proposal. The government has constricted public spending on medicines through a combination of therapeutic reference pricing that can tie the price of patented medicines to the lowest price generics, price cuts, fixed margins, high co-pays, restricted access to limited beneficiaries and other cost-containment measures. Poland’s government pricing and reimbursement system is underfunded and significantly backlogged, taking more than 827 days on average from EMA marketing authorization to patient access. Only 39 percent of new medicines launched globally since 2012 have launched in Poland, with Polish patients waiting an average of 26 months after global first launch for the medicines that become available. To promote access to innovation needed by patients, Poland should ensure that public health spending is allocated a sufficient share of public spending and implement market access measures that promote patient access to innovative medicines.

**Romania**

PhRMA and its member companies are concerned about the lack of health care funding, onerous pricing policies and long delays in accessing innovative medicines. Romania imposes significant market access barriers for medicines, including government price controls, other cost-containment measures and administrative hurdles that significantly restrict patient access. The Romanian health care system has historically been one of the most underfunded in Europe, with public health spending comprising an estimated 5.5 percent of GDP in 2021. Only 37 percent of new medicines launched globally since 2012 have launched in Romania, with patients waiting an average of 32 months for the medicines that become available.

The Romanian government operates a dual-pricing system aimed at relieving shortages caused by parallel exports to other EU member states: The Romanian government sets prices based on: 1) the lowest price in a basket of 12 EU countries for CANAMED (used for the public reimbursement process); and 2) the average of the lowest 3 countries for the Public Catalogue (used for international reference pricing by other EU countries). While this pricing policy was originally intended to protect patients in a lower GDP per capita country, it has ultimately led to further product shortages and a lack of patient access due to wealthier European countries both referencing lower Romanian prices and importing lower-priced products from Romania.

---

In Romania the inclusion of new medicines on the reimbursement list is an unpredictable process, often delayed by budget constraints. In 2023, due to budgetary constraints, no managed entry agreements for new medicines were finalized,\(^{293}\) leading to further delays in reimbursement for new medicines. The Romanian Government aims to identify alternative funding to improve access to innovation by creating a Health Innovation Fund. Progress has been made in this direction with the regulation of the Health Innovation Program through new legislation establishing the development of the National Plan for Preventing and Combating Cancer; however, implementation and operationalization of this program remains pending.

Spain

PhRMA and member companies are concerned that patient access to innovative medicines is being negatively impacted by rejections and delays in pricing and reimbursement procedures that lack transparency and consistent criteria. Only 43 percent of new medicines launched globally since 2012 have launched in Spain, with patients waiting an average of 23 months after global first launch for the medicines that become available.\(^ {294}\) Further, only 37 percent of new medicines are publicly reimbursed in Spain, with patients waiting an average of 37 months after global first launch for public reimbursement. In addition, there are varying sub-national access delays across Spanish regions after national reimbursement decisions have been made.

During the fiscal crisis of 2010-2012, Spain imposed aggressive cost-containment measures that remain in place despite the country’s economic rebound. Since 2010, these measures have collectively reduced pharmaceutical spending by 30 percent. Specific measures include the reimbursement delisting of more than 400 medicines, frequent direct and indirect price cuts, imposition of a 7.5 percent mandatory discount on reimbursed innovative medicines, 15 percent price rebate on medicines with more than 10 years on the market with no generic or biosimilar, restricted access for certain patient subpopulations and changes in pharmaceutical co-payment policies (e.g., pensioners began contributing a 10 percent co-payment, subject to caps and other limits).\(^ {295}\) Additional market access challenges have emerged with recent administrations, including: therapeutic reference pricing of innovative medicines based on a group of products that includes generics and biosimilars and mandatory prescribing by active ingredient for small molecules and biologics.

Sweden

Although Sweden is one of the wealthiest countries in Europe, the proportion of national health expenditure accounted for by pharmaceuticals has fallen from 12 percent

---

\(^{293}\) NHIH has only renewed the cost-volume/ cost-volume-results agreements for medicines already reimbursed.

in 2005 to just nine percent in 2021. Moreover, the Swedish Krona has declined against
the Euro significantly over the course of the past decade, accounting for approximately
60 percent of the decline in the overall relative price index with European countries since
2014. According to the Dental and Pharmaceutical Benefits Agency (TLV), about 60
percent of the price reduction for innovative medicines over 2014-2019 was due to
changes in exchange rates. With more than 25 countries referencing Sweden – including
Canada, Germany and Switzerland – the global knock-on effects of the Swedish Krona’s
relative depreciation were significant.

Biopharmaceutical innovators face an increasingly challenging and non-
transparent environment for government pricing and reimbursement. For example,
manufacturers must submit a proposed price to the TLV as part of their combined pricing
and reimbursement application. Unless the medicine has been identified as a candidate
for a managed entry agreement, the application is either accepted or rejected in a
nontransparent fashion. Although rejections can be appealed, the manufacturer is not
permitted to provide new evidence to support its case. In making pricing decisions, the
TLV employs an opaque “value-based” system which compares new products against
comparators it deems therapeutically equivalent, including medicines used outside the
reimbursement system and medicines used off-label. The TLV also engages in frequent
re-assessments of reimbursed medicines, which commonly result in price cuts, new
restrictions and even delisting. Only 46 percent of new medicines launched globally since
2012 have launched in Sweden, with patients waiting an average of 15 months after
global first launch for the medicines that become available.

Switzerland

Switzerland has compulsory private health insurance, but the government
regulates which medicines are reimbursed and sets the prices of those products based
on the prices in other European countries (all with lower GDP per capita) as well as based
on the prices of alternative therapies that may represent a lower standard of care.
Moreover, the pricing and reimbursement system lacks predictability and transparency
and fails to appropriately account for changes in currency exchange rates. For example,
in 2015 Switzerland expanded the basket of countries used in its international reference
pricing system for setting and adjusting prices of patented medicines. However, given the
increasing strength of the Swiss franc relative to other currencies in the basket (Euro, UK
Pound, Swedish Krona and Danish Krone), the practice has become even more
damaging as many of these currencies continue to lose value relative to the Swiss franc.
Compounding this issue, in 2017 the Swiss Government began setting prices based on
giving equal weight to the average international reference price and the average
therapeutic reference price. The products chosen for the therapeutic reference price are
often unpredictable and lack scientific evidence. Every year, one-third of the
reimbursement list is subject to price adjustments based on this approach. For the group
of 543 original brand medicines reviewed in 2018, 288 (53 percent) had their prices cut

---

by an average of 19 percent. Similarly, for the group of 478 original brand medicines reviewed in 2019, 257 (54 percent) had their prices cut by an average of 17 percent. In 2020, 300 drugs had their prices cut by an average of 11 percent. Manufacturers may also be required to pay back revenue after a product’s first triennial price review if the price was reduced by more than three percent and if the previous price generated more than CHF 20,000 in “excess revenue.”

Over the past two years, government pricing authorities have begun using additional tools such as capitation, pay for performance, indication-based pricing, budget impact tests and rebating for medicines used in combination or for multiple indications. As a result of these combined policies, Switzerland has experienced more pronounced market access delays for certain innovative medicines in recent years. Only 43 percent of new medicines launched globally since 2012 have launched in Switzerland, with patients waiting an average of 18 months after global first launch for the medicines that become available.298

298 *Id.*
INDIA

PhRMA and its member companies support India’s efforts to create a stronger business, innovation and health care environment. Recent supportive policies and initiatives in the healthcare space include Ayushman Bharat (AB) Health Infrastructure Mission to develop capacities of primary, secondary and tertiary care health systems, establishment of 1.2 lakh Health and Wellness centers, the revolution in healthcare through digitization of Electronic Health Records under AB Digital Health Mission and e-sanjeevani telemedicine services. In the policy space issuance of the draft Drugs, Medical Devices and Cosmetics Bill, 2022,299 Scheme for Strengthening of Pharmaceuticals Industry (SPI), the Department of Pharmaceuticals’ (DoP’s) draft policy on facilitating biopharmaceutical research, development and innovation, and the draft Patents (Amendment) Rules, 2023 are steps in the right direction.300 These policies and initiatives can help improve access to health care for Indian patients, while also driving economic growth by enhancing India’s global competitiveness.

Despite these positive signs, PhRMA and its member companies remain concerned about the challenging policy, regulatory and business environment in India. Market access challenges persist despite announcements to increase funding and expand health care programs. The Indian Government’s budgeted expenditure on health sector reached 2.1 percent of GDP in FY2023, against 1.6 percent in FY2021.301 PhRMA sincerely hopes that there is continued allocation of funds for the health sector and that the Government’s health expenditure is increased to 2.5 percent of GDP by 2025 as envisaged by the National Health Policy, 2017 and recommended by the 15th Finance Commission Report 2021.

Moreover, the National IPR Policy, 2016 puts forward an important framework for strengthening India’s innovation ecosystem. However, greater predictability and reliability is needed, and implementation and possible revision of the policy would offer an opportunity to advance concrete policy improvements. Indeed, the 161st Standing Committee Report, which reviewed the IP regime in India, recommended a review of the 2016 policy.302 It is promising that the Indian Government has launched a review of its patent laws.

The innovative biopharmaceutical industry greatly appreciates the efforts to address these concerns at the highest levels of the U.S. and Indian Governments. We welcome the opportunity to continue working with both Governments to improve access to medicines for patients and advancing a “Healthy India” by removing market access barriers and fostering legal and regulatory certainty for the protection of IP in India.

**Key Issues of Concern:**

- **Unpredictable patent environment:** As identified in the 161st Report of the Department Related Standing Committee on Commerce, a stronger IP protection framework would significantly contribute to India’s economic growth and enhance the country’s investment potential. India’s legal and regulatory systems pose procedural and substantive barriers at every step of the patent process, including: impermissible hurdles to patentability posed by Section 3(d) of India’s Patents Act, 1970, patent grant delays due to cyclic filings of pre-grant oppositions followed by rampant post-grant opposition proceedings, onerous patent application disclosure requirements and conditioning patent grant on unclear and subjective access and benefit sharing requirements that disproportionately affect foreign patent applicants. The issue of genus and species patents has been raised in a number of judicial proceedings and doubts over the validity of species patents beyond the term of any genus patent on a product have led to arbitrary court decisions. These shortcomings, coupled with the ongoing threat of compulsory licenses (CLs), demonstrate that much work needs to be done to improve the patent environment in India.

- **Lack of patent enforcement:** One of the most significant challenges facing biopharmaceutical innovators seeking marketing approval in India is that marketing and manufacturing approvals are not transparent or coordinated between the Central Drugs Standard Control Organization (CDSCO) and state agencies. After four years of the medicine’s first approval in India, any of the state/union territory (UT) drug regulators may grant a license to manufacture and market the product in India. The State/UT Drug Regulators are not required to inquire or assess whether the drug approval is being granted to a patent protected product, resulting in irreparable harm to patients, innovators and other follow-on producers.

- **Regulatory data protection failures:** Contrary to India’s obligations under Article 39.3 of the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS), regulatory authorities in India rely on test data submitted by originators to seek approval in India and/or another country when granting marketing approval to follow-on pharmaceutical products to third parties. This reliance results in unfair commercial use prohibited by the TRIPS Agreement and discourages the development and introduction into India of new medicines for unmet medical needs.
**Discriminatory and non-transparent government pricing policies:** PhRMA’s members understand the need for making medicines available and affordable in a market where most patients have to pay for their medicines out-of-pocket. At the same time however, there must be recognition of the research and development that goes into innovative medicines and for new cures for unmet medical needs. The National List of Essential Medicines (NLEM) 2022 released last September includes four patented medicines that will be included in Schedule I of the Drug Price Control Order 2013 (DPCO) and subject to price controls like generic medicines. PhRMA also remains concerned about the application of Trade Margin Rationalization (TMR) on high value non-scheduled medicines where trade margin is arrived at by a formula that does not exclude free medicines provided under Patient Assistance Programs (PAP), which results in deep price cuts on patented and proprietary medicines. Further, the 2019 amendment to Paragraph 32 of the DPCO that allows manufacturers of patented medicines to apply for exemption from price controls for five years from the commencement of marketing in India (as well as a permanent exemption for orphan drugs) has not been implemented for importers of patented medicines and orphan drugs. The overall lack of transparency, predictability and reasonableness in implementing policies that impact pricing of medicines creates an unviable business environment.

**Discriminatory government procurement policies:** The Indian Government’s Make in India policy has increasingly excluded or disadvantaged suppliers that do not manufacture in India from participating in tenders. In fact, suppliers of imported drugs are not eligible to bid in government procurement except in permitted Global Tender Enquiry (GTE). The General Financial Rules were amended in 2020 to exclude the participation of non-local suppliers (i.e., suppliers that do not meet the 20 percent minimum local content requirement) from government procurement where the value of the goods to be procured is less than INR 2 billion. The Department for Promotion of Industry and Internal Trade (DPIIT), Ministry of Commerce and Industry has consequently amended the 2017 Public Procurement Order (PPO) to disqualify non-local bidders in all government tenders of such value (except in permitted GTEs). The December 2020 notification issued by the DoP for procurement of medicines requires a minimum 80 percent local content to qualify as a favored Class 1 local supplier and more than 50 percent local content to qualify as a Class 2 local supplier. Further, in April 2022, DoP shared the details of local manufacturers of 67 medicines (subsequently revised to 60) to various central procurement agencies to assist them in procurement from a local supplier without regard to the patent status. The list included 19 potentially patent-infringing products manufactured in India, which resulted in several innovator companies filing infringement cases and obtaining interim injunctions against these local manufacturers.

**High tariffs and taxes on medicines:** Taxes, duties and other levies contribute substantially to pharmaceutical prices in India. Import duties for active ingredients and finished products with the basic import duties average around 10 percent.
When combined with the Integrated Goods and Service Tax, the effective tax can be as high as 28 percent with surcharges on these taxes included.303

- **Unpredictable environment for clinical research and new drug approval:** While the government is keen to reinvigorate clinical research in India, ambiguities and discriminatory practices in the Indian regulatory space continue to hinder that effort. In particular, the granting of waivers of India’s local clinical trials requirements is highly subjective and unpredictable. While notification of the New Drugs and Clinical Trials Rules, 2019 (NDCT) promingly proposed that local clinical trials could be waived if the clinical trials were conducted in certain countries, the list of relevant countries has yet to be published. Further, the provision allowing for deemed approval of clinical trials applications is discriminatory in nature, as it does not apply to drugs whose research and development was conducted outside of India. Furthermore, the Subject Expert Committees (SECs) that reviews and examines clinical trials and new drug applications do not have standard operating procedures (SOPs) or guidelines and, therefore, the recommendations made by them are often subjective and arbitrary. These issues perpetuate a burdensome environment for clinical research and new drug approvals that undermine the availability of new treatments and vaccines for Indian patients.

- **Counterfeit Medicines:** Counterfeit medicines pose serious and pervasive health and safety threats, and according to recent reports, more than half of the counterfeit medicines seized originated in India. Moreover, illicit trade in counterfeit medicines is growing, and the need to stem the flow of these counterfeit medications is even more pronounced given the global efforts to combat the COVID-19 pandemic.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

India announced its National IPR Policy in May 2016.304 The Policy recognizes the tremendous economic and socio-cultural benefits that a strong IP regime could bring to India through economic growth, employment and a vibrant R&D environment. The Policy also puts forward important administrative and procedural improvements. However, it has been more than seven years since the National IPR Policy was introduced, and a revision and update of the Policy, along with appropriate consultation with stakeholders, is necessary. A comprehensive overview of the applicable legislation and policies, in line with the recommendations outlined in the 161st Standing Committee Report, is necessary

---

to reassure India’s commitment to a strong IP framework.\footnote{Dep’t Related Parliamentary Standing Committee on Commerce, “Review of the Intellectual Property Rights Regime in India,” July 2021.} India’s recently launched review of its patent laws could help improve the IP environment in India and facilitate the development of innovative medicines in India.

**Restrictive Patentability Criteria**

PhRMA members continue to face considerable barriers at every step of the patent application process, including restrictive patentability criteria posed by Section 3(d) of India’s Patents Act, 1970, narrow patentability standards applied during pre- and post-grant opposition proceedings, conditioning patent grant on unclear and subjective access and benefit sharing requirements, and outdated patent application disclosure requirements.

TRIPS Article 27 requires that patents shall be available for any inventions, whether products or processes, in all fields of technology, provided that an invention is new, involves an inventive step and is capable of industrial application. Section 3(d) of the Indian Patents Act, 1970, as amended by the Patents (Amendment) Act 2005, adds an impermissible hurdle to patentability by adding a fourth substantive criterion of “enhanced efficacy” to the TRIPS requirements. Moreover, this additional hurdle appears to be applied only to pharmaceuticals. Under this provision, salts, esters, ethers, polymorphs, metabolites, pure form, particle size, isomers, mixtures of isomers, complexes, combinations and other derivatives of known substances are presumed to be the same substance as the original chemical entity and thus not patentable, unless it can be shown that they differ significantly in properties with regard to therapeutic efficacy. Further, indiscriminate and routine use of Section 3(d) by the Indian Patent Office during prosecution of patent applications even for a novel compound or a derivative, with the onus of proof on the applicant to prove otherwise, poses an unreasonable and unnecessary burden on innovators.

Additional substantive requirements for patentability beyond those enumerated in the TRIPS Agreement are inconsistent with India’s international obligations. For example, Article 27 of the TRIPS Agreement provides an exclusive list of the types of subject matter that can be precluded from patent coverage and this list does not include “new forms of known substances lacking enhanced therapeutic efficacy,” as excluded by Section 3(d) of the Indian law. Therefore, Section 3(d) is inconsistent with the framework provided by the TRIPS Agreement. Moreover, Section 3(d) represents an additional hurdle for patents on inventions specifically relating to chemical compounds and, therefore, the Indian law is in conflict with the non-discrimination principles provided by TRIPS Article 27 and WTO rules.\footnote{The additional patentability hurdle imposed by section 3(d) was recently reinforced by the Pharmaceutical Patent Examination Guidelines issued in October 2014.}

From a policy perspective, Section 3(d) undermines incentives for biopharmaceutical innovation by preventing patentability for improvements that do not
relate to efficacy, for example an invention relating to the improved safety or toxicity of a product. Further, Section 3(i) of the Indian Patents Act, 1970, excludes method of treatment claims, discouraging U.S. biotechnology companies with needed treatment methods from entering the Indian market and providing life-saving products.

India’s pre- and post-grant patent opposition system is another source of unreasonable restrictive standards for patentability. Patent revocations using “hindsight” analyses made during pre- and post-grant oppositions have cited a lack of inventiveness concluding that inventions were based on “old science” or failed to demonstrate an inventive step. In addition, the lack of clear rules guiding pleading and evidentiary standards during pre-grant opposition proceedings create further uncertainty relating to the patentability of inventions. Further, pre-grant opposition procedures under Section 25 of India’s Patents Act, 1970, have created significant uncertainty and delayed the introduction of new medicines by undermining patent office efficiency and delaying patent prosecution. A recent comprehensive report revealed that it takes almost 9 years to resolve pre-grant patent opposition disputes. The report also concluded that serial oppositions and oppositions filed by persons with no discernible interest or connection to the subject matter plague the pre-grant process and significantly delay patent grants. Further, the existing patent backlog and the absence of mechanisms such as patent term adjustment further complicate this process and contribute to the loss of patent life.

While PhRMA and its member companies continue to believe that eliminating the pre-grant opposition system is in India’s best interest, the Draft Patents (Amendment) Rules, 2023, improve India’s pre-grant opposition regime by ensuring the Controller consider the “maintainability” of the pre-grant petition. This requirement should be implemented in a manner that ensures only real parties in interest can file pre-grant opposition proceedings. Moreover, the Draft Patents (Amendment) Rules, 2023, should at least establish a deadline after which no pre-grant oppositions can be filed (e.g., six months from the date of issuance of the First Examination Report).

Weak Patent Enforcement

Indian law permits CDSCO to approve third-party manufacturers to commercialize copies of innovator chemically synthesized products, regardless of whether those products potentially infringe on an innovator’s patent(s). After four years of the medicine’s first approval in India, a medicine is deemed to no longer be a new drug. As such, approval from CDSCO is not required and a mere license from any of the state/UT drug regulators to manufacture and market the product in India suffices. Neither the Central nor State/UT regulatory authorities are required to verify or consider the remaining term of the patent protection on the original product. Therefore, an infringer can obtain marketing authorization from the CDSCO and manufacturing authorization from the

---

307 As per Rule 2(1)(w) of the New Drugs Clinical Trials Rules, 2019 a drug (apart from a modified or sustained release form of a drug or novel drug delivery system of any drug or a vaccine, r-DNA derived product, living modified organism, monoclonal anti-body, stem cell derived product, gene therapeutic product or xenografts, intended to be used as drug) “shall continue to be new drugs for a period of four years from the date of their permission granted by the Central Licensing Authority …. .”
state/UT drug regulator for a generic version of an on-patent drug, forcing the patent holder to seek redress in India’s court system, which often results in irreparable harm to the patent holder.

India’s National IPR Policy, 2016 calls for identification of important areas of potential policy development related to ambiguities between IP laws and other laws or authorities whose jurisdictions impact administration or enforcement of patents. At a minimum, through the draft Drugs, Medical Devices, and Cosmetics Bill, 2022, India should amend its rules for “new drugs” in the NDCT, by increasing the period a drug is considered “new” from four years to ten years (thereby extending the period before which a manufacturer can seek approval for a follow-on product).

India also does not provide mechanisms for notification or resolution of patent disputes prior to marketing approval of generic products. Such mechanisms are needed to prevent the marketing of potentially patent infringing products and resolve disputes in a timely manner. The SUGAM initiative launched in November 2015 to implement e-Governance with respect to the licensing system within India’s CDSCO lacks transparency and does not facilitate timely notification to a patentee of a possible infringement. In April 2017, India amended Form 44 of the Drugs and Cosmetics Rules to omit Item 8 which previously required new drug applicants to disclose the “patent status of the drug.” This action further eroded the ability of patent owners to effectively and timely notify generic manufacturers and state drug regulatory authorities of existing patents related to medicines approved by CDSCO or get timely and adequately notified of filing of applications for marketing or manufacturing approval by any subsequent applicant. CDSCO’s Notification GSR 19(E) dated January 10, 2019, falls short in providing an opportunity to facilitate notification of manufacturing applications between government agencies and patent holders under the SUGAM initiative. The industry has submitted many formal representations urging the Ministry of Health and Family Welfare (MoHFW) to take immediate steps to increase transparency and cooperation between central and state medicines regulatory authorities. At a minimum, MoHFW should ensure all biopharmaceutical manufacturers, the relevant Indian authorities and the broader public have timely notice of marketing and manufacturing applications filed with central and state regulators. Further, while the draft Drugs, Medical Devices and Cosmetics Bill, 2022 reflects on the relationship between the Central Licensing Authority and State Licensing Authorities, it falls short of ensuring that innovators have timely notice of manufacturing approval applications and are able to seek injunctive relief before potential patent infringing drugs enter the market.

With regard to patent enforcement, in at least one specific case, the patent holder was forced to wait seven years before receiving a court decision upholding its patent. In that case, the court ultimately did not grant an injunction because by the time the decision was issued the patent was close to expiration. In another case, a company waited two

308 See Secs. 3.8 and 3.8.3 of the National IPR Policy.

309 Form 44, Schedule A, Drugs and Cosmetics Rules, 1945.

310 Id.
years for a Court to grant an injunction. During that time the infringing product was marketed and sold. In some cases, defendants have started to obtain market authorizations and manufacturing licenses without the knowledge of the innovator and pre-emptively filing declaratory suits as to the non-infringement of the patents in a civil court so as to delay grant of any injunction orders. Moreover, while some innovators have been successful in obtaining interim injunctions, that relief is often very limited because infringers are only enjoined from future infringing acts, i.e., it does not prohibit the marketing of products already manufactured and/or launched.

The Commercial Courts, Commercial Division and Commercial Appellate Division of High Courts Act, 2015 (as amended in 2018) provides for the creation of commercial and commercial appellate divisions in High Courts and commercial courts at the district level to assist in addressing disputes in a timely manner. Moreover, the Delhi High Court and the Madras High Court have established Intellectual Property Divisions to facilitate adjudication of IP cases. While these are promising developments, these courts are overburdened with cases that require a significant amount of technical expertise and commitment of resources to be properly adjudicated. Moreover, there is a need to create similar divisions in the Calcutta and Bombay High Courts. Further, abolition of a dedicated appellate body, i.e., the Intellectual Property Appellate Board via the Tribunals Reforms Act, 2021, and the transfer of IP disputes to the High Courts further burdens an already overwhelmed court system and further delays access to timely court decisions and proceedings. Patents involve technical issues and therefore, designation of a specialized tribunal with the appropriate knowledge is critical for accurately examining and interpreting the issues involving complex technologies.

Compulsory Licensing

The grounds for issuing a CL in India under the Patents Act, 1970 are broad, vague and appear to include criteria that are not clearly related to legitimate health emergencies. While the Indian Government continues to take a more measured and cautious approach in responding to recent CL cases, the MoHFW continues to entertain potential recommendations to impose CLs on certain anti-cancer and rare disease medicines under the special provisions of Section 92 of India’s Patents Act, 1970, which would cause further difficulty for patent owners to defend their patents. Moreover, some Indian pharmaceutical companies routinely initiate requests for voluntary licenses under Section 84(6)(iv) of the Patents Act as a precursor to seeking a CL, reducing CLs to a commercial tool rather than a measure of last resort. Internationally, in various multilateral forums, India has advocated for the broad adoption and implementation of measures to facilitate the routine use of CLs, contrary to the spirit of the TRIPS Agreement. A market with ongoing threats of CLs perpetuates an unreliable environment for patent protection and investment.

In addition, Section 146 of the India Patents Act, 1970, further exacerbates the uncertainty and scope of India’s CL provisions. Rules promulgated under that section require all patent holders to file an annual statement summarizing “the extent to which the
A patented invention has been worked on a commercial scale in India.\textsuperscript{311} Notwithstanding the commercially sensitive nature of information required to satisfy Section 146, it also provides an impermissible basis for local companies to seek CLs, as occurred in 2012. Moreover, the rationale for requesting this information is unclear and appears merely to be a disguise for facilitating questionable administrative challenges to existing patents. Despite the changes to Form 27 made in 2020, the ambiguity around the definition of ‘working of patents’ remain. While PhRMA continues to believe that Form 27 is not necessary, PhRMA welcomes the changes proposed in the Draft Patents (Amendment) Rules, 2023, to amend Form 27, and recommends that Form 27 also provide innovators the option to briefly explain why a patent has not been worked in India. For regulated industries such as the biopharmaceutical sector, it is impossible to work the patent at a commercial scale before the product has secured marketing approval.

We believe that resorting to CLs is not a sustainable or effective way to address health care needs. Voluntary arrangements independently undertaken by our member companies can better ensure that current and future patients have access to innovative medicines. Statements from the government incorrectly imply that CLs are widely used by other governments, both developed and developing.\textsuperscript{312} These are misunderstandings and do not justify widespread use of CLs.

At a minimum, India should ensure that CLs are exercised with extreme caution and as a measure of last resort. The language in the Draft Patents (Amendment) Rules, 2023, making clear that importation satisfies the working requirement is a positive development. Further, India must maintain the confidentiality of the working statement disclosures made under Form 27.

**Administrative Burdens**

PhRMA welcomes the Indian Government’s ongoing work to address India’s patent examination backlog including the commitment to reduce examination periods from up to seven years to 18 months from initial submission. Backlogs undermine incentives to innovate and hinder timely patient access to valuable new treatments and cures. Because the term of a patent begins on the date an application is first filed, unreasonable delays can directly reduce the value of granted patents and undermine investment in future research activity. For biopharmaceutical companies, patent examination backlogs can postpone clinical trial activity and ultimately the introduction of new medicines in India. Generic manufacturers are also affected by patent examination backlogs. So long as a patent application is unreasonably delayed, generic manufacturers cannot assess whether they will have freedom to operate. That lack of certainty could discourage the launch of generic medicines or expose generic companies to damages once the patent is granted. In addition to increasing the number of patent examiners, it is

\begin{itemize}
\item \textsuperscript{311} India Patents Act, Section 146(2).
\end{itemize}
equally important to assess administrative procedures that unduly extend patent examination timelines.

Section 8 of the Indian Patents Act sets forth requirements that have been interpreted in a manner that creates heightened and unduly burdensome procedures that mainly impact foreign patent applicants – those most likely to have patent applications pending in other jurisdictions. Section 8(1) requires patent applicants to notify the Controller and “keep the Controller informed in writing” of the “detailed particulars” of patent applications for the “same or substantially the same invention” filed outside of India. Section 8(2) requires a patent applicant in India to furnish details to the Indian Controller about the processing of those corresponding foreign patent applications if that information is requested. These additional patent application processing requirements have been interpreted in a manner that creates heightened and unduly burdensome patent application procedures that mainly impact foreign patent applicants – those most likely to have patent applications pending in other jurisdictions.

Section 8 was enacted in 1970 when the information was only available from the applicant; much of the information sought is now publicly available on patent office websites in most major jurisdictions. For example, through the Global Dossier Initiative of five major patent offices (the U.S. Patent and Trademark Office, the European Patent Office, the State Intellectual Property Office of China, the Japanese Patent Office and the Korean Intellectual Property Office), the current file histories from each of these offices are accessible at one website. Thus, accurate information about counterpart foreign applications is readily available to the India Patent Office examiners. Recent court decisions provide greater clarity on the applicability and scope of Section 8. In particular, current jurisprudence limits Section 8 to information that is material to patentability and to deliberate failures to disclose this information.313

Moreover, the Guidelines for the examiners in the Manual of Patent Office Practice and Procedure (MPOPP) notified by CGPDTM on November 26, 2019 directs patent examiners to utilize resources available at WIPO DAS (Digital Access Service) and WIPO CASE (Centralised Access to Search and Examination) and to recognize the evolved jurisprudence by the Indian Courts. In particular, industry was glad to see that the initial proposal in the MPOPP to expand the definition of “person interested” beyond the definition provided under the Patents Act, 1970, was dropped in the final MPOPP. However, implementation of the Guidelines remains inconsistent such that examiners continue to seek information from applicants that is available in the WIPO DAS and CASE databases.

Additionally, requests pursuant to Section 8(2) for the translation of foreign search and/or examination reports are not only unduly burdensome but costly as well. In practice, attorneys routinely receive informal translations of foreign search and/or examination reports intermingled with local attorney advice and counsel (information subject to attorney-client privilege). Moreover, translations of the search and/or examination reports may not yet be available at the time of the Section 8(2) request.

Further, the remedy for failure to comply with Sections 8(1) and 8(2) is extreme compared to other countries with similar (but less onerous) administrative requirements. In India, the failure to disclose under Section 8 can be treated as a strict liability offense that by itself can invalidate a patent (although a recent court decision indicates some flexibility for mere clerical errors). This is in contrast to a requirement that the failure to disclose be material and/or intentional as in the U.S. Thus, India’s disclosure requirement and remedy are each more burdensome as compared to other jurisdictions, thereby creating a barrier to patentability that has an unfairly greater effect on foreign patent applicants and, in some instances, resulted in India revoking patents and denying injunctions on the grounds of non-compliance with this particular provision.314

The Draft Patents (Amendment) Rules, 2023, propose changes that would mitigate some of the harmful impacts of the Section 8 filing requirements. For example, requiring that examiners leverage public databases (e.g., patent office websites) to satisfy the Section 8 filing requirements is a positive development. PhRMA recommends that the information being considered via the public databases be limited to information that is material to patentability, and that penalties under Section 8 be limited to deliberate failures to disclose information (which is consistent with current jurisprudence in India).

PhRMA also welcomes the adoption of a Patent Prosecution Highway (PPH) program between the Indian Patent Office (IPO) and the Japan Patent Office (JPO) and the release of the Procedure Guidelines for the PPH. However, the guidelines lay down procedures to file a PPH request in certain specified technical fields only, namely, Electrical, Electronics, Computer Science, Information Technology, Physics, Civil, Mechanical, Textiles, Automobiles and Metallurgy while JPO may receive applications in all fields of technology. We believe that PPH requests in India should be extended to all fields of technology, including biopharmaceuticals.

Regulatory Data Protection Failures

Contrary to its TRIPS Article 39.3 obligation, India fails to prevent unfair commercial use of the regulatory data submitted by an innovator in securing marketing approval in India or in a third country. Rather, when a pharmaceutical product has been previously approved by a Regulatory Authority in India or in another country, India requires only limited clinical data in lieu of requiring submission of the entire dossier by the applicant for review by India’s regulatory authority. Moreover, in some instances when an applicant seeks approval for a generic or biosimilar product that has already been

---

314 See, e.g., Ajantha Pharma Ltd. v. Allergan, Intellectual Property Appellate Board (2013) and Astrazeneca AB and Ors. vs. Torrent Pharm Ltd. and Ors. [MANU/DE/2064/2020].
approved in other countries, Indian authorities waive the requirement to submit even this data.\textsuperscript{315} In those circumstances, any subsequent approval of the drug granted to an entity who is not an innovator in India is based entirely on the prior approval granted to the innovator in a third country.

By linking approval in other countries that require the submission of confidential test and other data to its own drug approval process, India, in effect, uses those countries as its agents. Approval by the Indian regulatory authorities to third parties based on other-country approvals amounts to indirect and unfair reliance on the clinical trial and other test data generated and submitted by the innovators for such other-country approvals. This indirect reliance results in unfair commercial use, which is prohibited by TRIPS Article 39.3.

PhRMA and its member companies are committed to engaging with the Indian Government for the latter’s consideration to provide for RDP in the Drugs, Medical Devices and Cosmetics Bill 2022, consistent with India’s international commitments.

\textbf{Market Access}

\textbf{Discriminatory and Nontransparent Government Pricing Policies}

Despite decades of government price controls ostensibly seeking to improve patient access to medicines, just 17 percent of new medicines launched globally since 2012 are available in India, compared to an average of 38 percent in G20 countries, and patients in India wait an average of 42 months from global first launch for new medicines that become available.\textsuperscript{316} Even basic medicines are not easily accessible. This is despite having thousands of biopharmaceutical manufacturers which operate in a very competitive environment with some of the lowest prices of medicines in the world.\textsuperscript{317} Instead of resorting to these failed policies, India should focus on removing key barriers to patient access, including insufficient health care financing and infrastructure.

In 2014, an Inter-Ministerial Committee was constituted to suggest a methodology to be applied to the pricing of patented medicines in India.\textsuperscript{318} Earlier, a DoP Committee Report on Price Negotiation for Patented Drugs (February 2013) recommended an international reference pricing scheme with a purchasing power parity adjustment for

\textsuperscript{317} Analysis based on IMS MIDAS Data.

government procured patented medicines, with those patented medicines to be provided through health insurance. A final decision on the 2014 Inter-Ministerial Committee recommendations has yet to be made. However, PhRMA and its member companies are concerned that the 2013 proposals could be adopted, which would significantly reduce the benefits of patent protection, de facto discriminate against importers in order to pacify the domestic generic industry and create an unworkable government pricing framework and business environment for innovative pharmaceutical companies.

PhRMA and its member companies supported the DoP decision to amend Paragraph 32(i) of the DPCO allowing manufacturers and importers of patented medicines exemption from price controls for a period of five years from the commencement of marketing in India. However, Paragraph 32(iv), which was inserted to exempt medicines for treating orphan diseases, has not been implemented yet because the list of medicines for orphan diseases has not been released.

More broadly, PhRMA and its member companies are concerned about an evolving price control regime that is discriminatory, unpredictable and opaque. The DoP is considering several amendments to the DPCO that would expand price controls in India to all strengths and doses of a scheduled medicine, and introduce TMR to all non-scheduled medicines, which will operate in practice as another form of price controls.

PhRMA and its member companies generally supported the 2019 introduction of TMR as a more sensible approach to monitoring the price build-up by actors in the retail supply chain for non-scheduled products. Specifically, the government proposed regulating a retail ceiling price based on the price-to-stockist (PTS) plus a 30 percent margin. However, the PTS used by the government since 2021 was not the actual PTS (which is verifiable from government data sources), but rather a derived figure that includes products that do not have retail trade channels, including government supplies, free products and discounted products supplied through patient assistance programs. Inclusion of these non-retail products serves to bias downward the regulated retail ceiling price, penalizing PhRMA member companies for providing discounted products to improve patient affordability. In short, the current application of TMR is less about regulating excessive retail trade margins and more about imposing arbitrary price controls on non-scheduled innovative medicines. As a result, the retail ceiling prices set by the government under TMR are as much as 70 percent lower than the company’s Maximum Retail Price and therefore significantly exceed the existing trade margins added by other actors in the supply chain. This is inconsistent with the mandate of DPCO and NPPP 2012, which envisaged only a price monitoring mechanism for non-scheduled products. These developments underscore how the broad authority granted to the NPPA and the continued lack of transparency and predictability in NPPA decisions further inhibit investment in India.

The expansion of price controls to a broader scope of medicines will not substantially improve access to medicines in India, as the real barriers are insufficient
health care financing, poor access to physicians and inadequate health care facilities. For example, even therapies and vaccines offered free of charge often do not reach the patients who need these medicines. A 2015 study by IMS titled “Analyzing the Impact of Price Controls on Access to Medicines” found that price controls are neither an effective nor a sustainable strategy for improving patient access. The study found that the primary beneficiaries of price controls have been high-income patients, rather than the intended low-income population. A considerable body of evidence demonstrates that price controls contribute to lower investment in pharmaceutical research and development, ultimately harming patients who need improved therapies. The Annual Economic Survey also clearly highlighted that price control of medicines has not improved access.

PhRMA and its member companies remain concerned that patented medicines are being included in the NLEM. Once medicines are included in the NLEM, they are subjected to direct price controls under the DPCO. NLEM 2022 includes four patented products. The Parliamentary Standing Committee on Health and Family Welfare recognized that patented products should be excluded from the NLEM and specifically recommended that: “There needs to be a predictable and transparent pricing regime in the country. Patented drugs should not be included under the NLEM as their price fixation will nullify the IPR so granted.”

PhRMA and its member companies are committed to engaging with the Indian Government to discuss more pragmatic public policy approaches, including the development of government pricing and reimbursement mechanisms that provide patients with greater access to medicines, recognize innovation and encourage continued investment into unmet medical needs.

---

Discriminatory Government Procurement Policies

The Indian Government’s Make in India policy has increasingly excluded or disadvantaged suppliers that do not manufacture in India from participating in tenders. On May 15, 2020, the General Financial Rules 161(iv) were amended by inserting a new clause (b) prohibiting international tenders where the value of the goods to be procured is less than INR 2 billion. In addition, in September 2020, the Department for Promotion of Industry and Internal Trade (DPIIT), Ministry of Commerce and Industry issued a revised Public Procurement Order that discriminates against non-local bidders (i.e., products with less than 20 percent local content) in all government tenders (except in permitted international tenders), although there are some exemptions to ensure operational continuity. The revised PPO further provides for exclusion of bidders from countries that do not allow Indian bidders in their government procurements. Further, in December 2020, the DoP issued yet another restrictive order requiring a minimum 80 percent local content to qualify as a favored Class 1 local supplier and more than 50 percent local content to qualify as a Class 2 local supplier.324 This current framework creates challenges for PhRMA member companies to continue supplying patented medicines that are manufactured outside India to government procurers. In April the Indian Government created a list of Global Tender Enquiry (GTE) exceptions (exempt from localization requirements) that include 70 patented drugs. This list remains without updates or additions to date. PhRMA and its member companies encourage the Indian Government to add patented therapies to this list on an automated biannual basis, along with reviews of the GTE exemption list.

Thus, the Make in India Policy of the Government has increasingly excluded suppliers that do not manufacture in India from participating in tenders and has facilitated the potential government purchase of patent-infringing products. This raises significant concerns about discrimination against imported products and patent holders, and that Indian patients will not have access to needed treatments.

High Tariffs and Taxes on Medicines

PhRMA member companies operating in India face high import duties for active ingredients and finished products. Though the basic import duties for pharmaceutical products average about 10 percent, due to the integrated GST imposed on imports, the effective taxes on imported medicines can exceed 20 percent and almost be as high as 28 percent with surcharges on these taxes included. Moreover, excessive duties on the reagents and equipment imported for use in research and development and manufacture of biotech products make biotech and pharmaceutical operations difficult to sustain. Compared to other Asian countries in similar stages of development, import duties in India are very high. And while certain essential and life-saving medicines may be granted exemptions from some of the taxes, even these are affected by the Government’s policy.

objective to promote domestic manufacturing. The Indian Government has phased out custom duty exemptions on more than 70 life-saving medicines, a trend that is likely to continue. For those medicines that get the benefit of exemptions, the eligibility criteria are vague and subject to constant revision and debate.

GST was implemented in July 2017 and, while it is expected to significantly reduce layers and complexity in the indirect tax system, it levies a 0 to 18 percent tax on medicines. Measures to exempt life-saving drugs from GST and customs duties should be expanded to all medicines. In March 2021, the Indian Government launched the National Policy for Treatment of Rare Diseases (NPTRD). The policy highlights the need to increase the affordability of medicines for rare diseases. The Indian Government has already given exemption from Basic Customs Duty to such drugs when they are imported by the Centres of Excellence (CoEs) set up under the NPTRD. In addition, the Indian Government has also exempted rare disease medicines from customs duty.

However, there remain a large number of patients receiving treatments not covered under CoEs, and whose drugs are subject to a customs duty of 10 percent, which creates a huge burden and adversely impacts access. Given the spirit of the NPTRD and the significant impact of rare diseases on child health, customs duty exemptions applicable to CoEs should be extended to all medical institutions and importers, including those in the private sector.

**Insufficient Financing and Low Access to Care**

PhRMA’s members are concerned about the general lack of access to health care in India. The Indian Government released the National Health Policy in March 2017, which calls for greater access to health care for low-income patients, and the launch of Ayushman Bharat scheme in February 2018. The National Health Policy denotes expanding comprehensive primary health care through health and wellness centers, including care for major non-communicable diseases (NCDs), mental health, geriatric health care, palliative care and rehabilitative care services. The policy also calls for increasing public health expenditure to 2.5 percent of GDP by 2025.

While these calls to action are laudable, India nevertheless has insufficient numbers of qualified health care personnel, inadequate and poorly equipped health care facilities, and most importantly lacks a comprehensive system of health care financing that would pool financial risk through insurance and help to share the cost burdens. Although Prime Minister Modi launched Ayushman Bharat, India has a shortage of health care workers. The doctor-population ratio is 1:834 in the country assuming 80 percent

---

availability of registered allopathic doctors. This is significantly lower than the norms set by the World Health Organization. This shortfall is exacerbated by limited government investment and low allocation for health care in the national budget. Despite the encouraging and ambitious goals in the new National Health Policy and the MoHFW's goal of increasing health spending as a percentage of GDP to 2.5 percent by 2025, government spending on health care is currently 2.1 percent, a large portion of which was allocated to the COVID-19 vaccination program. Without continued increased resources (both in terms of government spending and through reducing barriers for commercial health insurance) and a full implementation of the reform, high out-of-pocket spending on health care and pressure on the cost of medicines will persist.

Unpredictable Environment for Clinical Research and Drug Approval

India has many of the components of an effective regulatory system, such as institutional capacity across central and state regulators and a robust technical framework. India also has several components to support a broader ecosystem for clinical research and drug development, such as the presence of a highly skilled workforce of qualified scientists, hundreds of medical colleges and a large and diverse patient pool.

We welcome the fact that the MoHFW and CDSCO have undertaken regulatory reforms, including adoption of the NDCT, with the goal of strengthening the regulatory regime and reinvigorating clinical research. Strong, transparent and predictable regulatory frameworks that are aligned to international best practices are essential for protecting patients as well as for promoting globally competitive innovative and generic pharmaceutical industries. We also welcome the Government of India’s decision to overhaul the drug regulations with a new draft Drugs, Medical Devices and Cosmetics Bill (draft DMDC Bill) likely to be introduced in the winter session of Parliament.

However, as noted above, the NDCT includes significant ambiguities, which creates uncertainty in the regulatory process for clinical trials and threaten the overall clinical research environment in India. These issues must be addressed in order to increase the availability of new treatments and vaccines for Indian patients.

Further, certain challenges that existed in the Drugs Rules 1945, continue to exist in the NDCT. Rule 41 of the NDCT, which describes attributable causes of injury for clinical trials participants, is overly broad and lacks a legally or scientifically sound process for determining causality of injury. Definitions for “trial related injury” and “standard of care,” remain uncertain. Furthermore, many provisions in the NDCT are ambiguous and

---

highly subjective. For example, the provisions on local phase III clinical trial waiver lack clarity; the list of countries to be notified by the regulator under the NDCT for seeking waiver of local phase III clinical trial is yet to be notified; and the NDCT do not designate an appellate authority for hearing appeals arising from SEC recommendations. Further, with no guidelines/SOPs for the SECs, reviewing the applications for clinical trials and new drug approval heightens the existing subjectivity. Furthermore, requests for review of SEC decisions tend to be reviewed by the same SEC panel against the principles of *nemo judex in causa sua* and therefore in breach of principles of natural justice. In addition, the provision allowing for approval of clinical trial applications is discriminatory in nature due to significant differences in approval timelines for molecules discovered in India (30 days) compared to drugs for which research and development were conducted outside of India (90 days).

As a result, adoption of the NDCT leaves great uncertainty relating to future costs and liabilities associated with conducting clinical trials in India, resulting in many sponsors not launching clinical trials in India until these uncertainties have been resolved. Research shows that if India were to address outstanding concerns, India could see an increase in the number of new clinical trials per year to above 800, adding over $600 million in economic gains. Greater clarity and predictability are needed for administrative procedures and regulations *qua* drug registration applications, drug labelling standards and drug review standards and procedures in order to make the latest research products available in India. The draft DMDC Bill and the proposed Rules to be made thereunder, must provide for streamlined, predictable and transparent regulatory processes aligned with global standards.

Further, PhRMA members are concerned that the MoHFW has notified draft amendments to the NDCT vide GSR 354(E) dated June 5, 2020, proposing to permit import and manufacture of unapproved candidates that are under Phase-III clinical trial in the country, or in any other country, for compassionate use for diagnosis, treatment, mitigation or prevention of any life-threatening disease or disease causing serious permanent disability or disease requiring therapy for an unmet medical need. Critically, these proposed amendments would allow for such import and manufacture not only by the sponsor of the unapproved drug under the treatment protocol, but also by third parties. PhRMA members believe that such a proposal will not only discourage research and development that is critical for addressing unmet medical needs but would also put patient safety at risk and compromise clinical trial data.

Furthermore, the SECs that review and examine clinical trials and new drug applications do not have SOPs or guidelines and, therefore, the recommendations made by them are often subjective and arbitrary. These issues perpetuate a burdensome environment for clinical research and new drug approvals that undermine the availability of new treatments and vaccines for Indian patients.

---

Counterfeit Medicines

Illicit trade in counterfeit pharmaceutical products, poses significant global public health risks. Counterfeit medicines are not inspected by relevant regulatory authorities and are subject to production under unsafe manufacturing practices. Further, counterfeit medicines have not undergone the rigorous protocols used to ensure quality, efficacy and safety, and contribute to drug and multi-drug resistance, intensifying the challenge of effectively fighting disease. Exacerbated by the rapid growth of online sales of counterfeit medicines, studies indicate that more than half the counterfeit medicines seized in recent years originated in India. Moreover, Indian authorities have seized large quantities of counterfeit COVID-19 related medical products ranging from oxygen to antivirals. Indeed, in August 2021, the World Health Organization issued an alert related to counterfeit COVID-19 vaccines present in multiple countries including India. The Indian government should work with relevant stakeholders to address the growing illicit trade in counterfeit and unregulated medicines which is putting lives at risk.

INDONESIA

PhRMA and its member companies operating in Indonesia see tremendous opportunities to contribute further to Indonesia’s health care goals. However, longstanding market access and intellectual property (IP) barriers in this large and growing market continue to hinder possible partnerships from delivering on their full potential. The Indonesian Government appears sincere in its desire to address these barriers, notably through recent regulatory reforms in the 2020 Omnibus Job Creation Law and further action is expected through pending amendments to the 2016 Patent Law. Despite these positive actions, it appears the Indonesian government leveraged the COVID-19 pandemic to impermissibly implement industrial policies that prioritize medicines that are produced in Indonesia. For example, a presidential instruction to promote government procurement of domestic goods and services was issued last year. Also, in 2021, the Indonesian government issued compulsory licenses (CLs) for certain antiviral COVID-19 therapeutics: for one of these treatments, the Indonesian Government disregarded the voluntary licensing agreement already in place between the right holder and generic manufacturers to supply the Indonesian market with the therapeutic.

Key Issues of Concern:

- **Compulsory licensing:** In 2021, Indonesia issued CLs for antiviral COVID-19 therapeutics. Moreover, Indonesia issued a CL for one of these antiviral therapeutics despite the rights holder entering into a voluntary licensing agreement with generic manufacturers to supply the Indonesian market. Also, in 2020, Indonesia issued Presidential Regulation No. 77/2020 on government use of CLs. The regulation was published in final form without meaningful stakeholder consultation. The regulation broadly enables government agencies to request CLs for pharmaceutical products to address emergency needs in the public interest. If a CL is granted and the government is unable to implement the patent, it may appoint a third party to do so. Despite efforts in 2019 to address and revise existing CL regulations to align more appropriately with global norms and best practices, this new regulation and the process by which it was developed and issued, along with the CLs for the antiviral COVID-19 therapeutics, send a troubling signal to innovators.

- **Restrictive patentability criteria:** 2016 amendments to the Patent Law preclude patents on new uses (indications) and establish an additional patentability criterion of “increased meaningful benefit” for certain forms of innovation, such as new salts or new dosage forms. These restrictions are overly broad and will undermine support for important innovations and appear to conflict with existing international obligations by imposing additional or heightened patentability criteria that discriminate against particular classes of technology. The Patent Office has been implementing technical guidelines that remove this impermissible restriction, but the underlying provisions in the 2016 Patent Law remain unchanged. In addition, the 2016 Patent Law still imposes new patent disclosure requirements regarding the source and origin of genetic resources. Such requirements introduce
uncertainties into the patent system that inhibit innovation in relevant technologies and undermine the potential of benefit-sharing.

- **Forced localization requirements**: The newly issued 2023 Omnibus Health Law emphasizes prioritization for use of locally-made products. In addition, while the revisions to Article 20 of the 2016 Patent Law in the 2020 Omnibus Job Creation Law are a positive step forward, other forced localization requirements still remain in Decree 1010. PhRMA looks forward to additional measures to address outstanding concerns regarding Decree 1010 to ensure that Indonesian patients have access to new medicines.

- **Cost-focused formulary decisions**: While Indonesia is to be commended for developing guidelines and an online portal for listing new medicines on the Indonesian National Formulary, actual listing decisions appear to be primarily based on price and the overall National Health Insurance (JKN) budget. Only two percent of new medicines launched globally since 2012 are reimbursed by the JKN, with patients in Indonesia waiting an average of 71 months after global first launch for JKN reimbursement.335 Consistent with Indonesian Government guidelines, listing decisions should better reflect all evidence submitted, including scientific data demonstrating the product’s safety and efficacy. To this end, PhRMA member companies encourage the Indonesian government to take a more holistic approach to health technology assessment (HTA) for procuring medicines, including during the much-welcomed initiative from the Ministry of Health (MoH) to revise the HTA guidelines.

- **Mandatory halal certification**: In November 2020, the Indonesian Parliament partly revised the 2014 Halal Products Law through the Omnibus Job Creation Law, and in February 2021 implemented the Omnibus provisions through Regulation No 39/2021. The revisions streamline the certification process; however, they do not address key concerns regarding the Halal labelling policy. The Halal Law has broad application to all consumables, including biopharmaceuticals, and requires that producers label their products as “halal” if certified, or otherwise cite non-halal substances. PhRMA’s member companies recognize and support religious and cultural sensitivities but are concerned that this mandatory labeling requirement, including audits and certification for COVID-19 vaccines and therapeutics, could have unexpected negative implications on patient health and broader public health priorities.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

---

Intellectual Property Protection

Compulsory Licensing

In 2021, Indonesia issued CLs for antiviral COVID-19 therapeutics. For one of these antivirals, Indonesia issued a CL despite an existing voluntary licensing agreement in place with generic manufacturers in countries supplying the drugs to Indonesia. Also, in 2020, Indonesia issued Presidential Regulation No. 77/2020, on government use of CLs. The regulation was published without meaningful stakeholder consultation. The regulation enables government agencies to request CLs for pharmaceutical products to address emergency needs in the public interest and establishes a process to evaluate requests. If a CL is granted and the government is unable to implement the patent, it may appoint a third party to do so, subject to certain conditions. While the government must notify the patent holder when a request is accepted for review, there is no formal procedure allowing patent holders to dispute claims in a request or recommend alternatives. If a CL is granted to address emergency needs, the right holder must continue to pay fees to maintain the patent. The regulation also does not expressly permit or prohibit imports or exports of products manufactured under CLs.

While this new regulation is not targeted at specific products, it clearly poses an immediate threat to COVID-19 treatments and vaccines and could be used against other products the government deems necessary for emergency purposes in the future without due process or engagement with the patent holder. Indeed, PhRMA and its members are concerned about the Indonesian Government’s government-use licensing for COVID-19 medicines that are already available to Indonesian patients under voluntary licensing agreements. Before resorting to compulsory or government-use licenses, Indonesia should first consider the unprecedented industry collaboration and access strategies, including voluntary licensing, deployed by pharmaceutical companies to address emergencies like the current COVID-19 pandemic. CLs will not necessarily speed access to complex set of treatments and vaccines that are currently being tested and developed and should only be used in accordance with international rules and as a measure of last resort. Further, such actions are likely to undercut Indonesia’s effort to attract foreign investment and negate the recent positive steps undertaken to align public policy reforms to global best practices. The Indonesian Government should focus on accelerating the necessary regulatory approvals and streamlining procurement processes for COVID-19 medicines, rather than assuming IP is a barrier to access medicines or leveraging the COVID-19 pandemic and CLs to impermissibly implement local industry policy.

The 2016 Patent Law and implementing regulations create further uncertainty in this area by discouraging voluntary licensing agreements between private parties and promoting compulsory licensing on grounds that are vague or appear to be inconsistent with Indonesia’s international obligations. In particular, Article 79 of the Patent Law unnecessarily requires disclosure of private licensing agreements. However, we welcome that the 2020 Omnibus Job Creation Law decouples the local production requirement from CLs and aligns Indonesia’s patent working requirements with international rules to include the manufacture, importation and/or licensing of a patented invention in
Indonesia. Unfortunately, the CLs issued for antiviral COVID-19 therapeutics negate some of these positive developments. These CLs undermine manufacturing commitments and voluntary licensing initiatives in Indonesia. Moreover, these CLs could undercut Indonesia’s effort to attract foreign investment and compromise the country’s efforts to align its patent regime with global best practices.

Separately, PhRMA and its member companies also welcome the process the MLHR has initiated to amend the existing Patent Law (2016). Indonesia should make clear in the revised law that that CLs are used only in exceptional circumstances and assessed on a patent-by-patent basis with full consideration of the particular circumstances in each case. CLs should only be used in extraordinary circumstances as a last resort rather than standard government practice. As a general matter, CLs are not a sustainable or effective way to address health care needs. Voluntary arrangements independently undertaken by member companies better ensure that current and future patients have access to innovative medicines.

Restrictive Patentability Criteria

The Patent Law precludes patents on new uses (indications) and establishes an additional patentability criterion of “increased meaningful benefit” for certain forms of innovation, such as new salts or new dosage forms. These restrictions undermine support for important innovations and are contrary to existing international obligations by imposing additional or heightened patentability criteria in a manner that discriminates against particular classes of technology. While this issue has been partially addressed through revisions to the Patent Office’s internal technical guidelines, the underlying 2016 Patent law provisions remain unchanged. Such requirements introduce uncertainties into the patent system that inhibit innovation in relevant technologies and undermine the potential of benefit-sharing.

To bring valuable new medicines to patients, biopharmaceutical innovators must be able to secure patents on all inventions that are new, involve an inventive step and are capable of industrial application. Restrictions that narrow patentability prevent innovators from building on prior knowledge to develop valuable new and improved treatments that can improve health outcomes and/or reduce costs by making it easier for patients to take medicines and improving patient adherence to prescribed therapies.

Additional substantive requirements for patentability beyond that the invention be new, involve an inventive step and capable of industrial application, are inconsistent with the TRIPS Agreement. Article 27 of the TRIPS Agreement provides a non-extendable list of the types of subject matter that can be excluded from patent coverage and this list does not include new uses of existing compounds. Therefore, the Patent Law appears to be inconsistent with the framework provided by the TRIPS Agreement. Moreover, the Patent Law imposes an additional hurdle for patents on inventions specifically relating to chemical compounds and, therefore, is in conflict with the non-discrimination principle provided by TRIPS Article 27. Promisingly, consultations during the summer suggest that
the Indonesian Government plans to eliminate this patentability restriction when it revises the Patent Law. PhRMA and its members strongly support this proposal.

Burdensome and Vague Disclosure Obligations

The Patent Law also requires disclosure of the origin of genetic resources or traditional knowledge “related” to inventions. We support the objectives of the Convention on Biological Diversity (“CBD”) and recognize the national sovereignty of States over biological resources. However, such requirements introduce uncertainties into the patent system that inhibit innovation in relevant technologies and undermine the potential of benefit-sharing. The current proposed amendments to the Patent Law (as discussed during the consultations over the summer) do not adequately address this concern. Instead, we recommend eliminating these disclosure requirements that introduce uncertainty for innovators and undermine the sustainable use of technology related to biological resources.

Market Access

Forced Localization Requirements

In October 2020, the Indonesian parliament passed the government-initiated Omnibus Bill into law that revised 76 existing laws, including partial revision of the 2016 Patent Law. Specifically, the Omnibus Job Creation Law revised Article 20 of the 2016 Patent Law, such that a manufacturer is no longer required to locally produce the product in order to be considered “working” the patent in Indonesia. As a result of this change, patent holders are required to ensure the availability of the patented products in Indonesia to preserve their patents, which can be achieved through importation or licensing. While this law was a positive step forward, forced localization measures remain in some other regulations.

Decree 1010/MENKES/PER/XI/2008 (“Decree 1010”), formally implemented in November 2010, prevents multinational research-based biopharmaceutical companies from obtaining marketing authorization for their products if not meeting certain criteria. Under Decree 1010, only companies registered as “local pharmaceutical industry” are granted marketing approval. As several of PhRMA’s member companies do not manufacture products in Indonesia, they are instead classified as distributors, or “PBF” enterprises even though they follow globally recognized good manufacturing practices in the same manner as other high quality pharmaceutical firms manufacturing in Indonesia. Products of multinational research-based pharmaceutical companies and other foreign companies are barred from the Indonesian market unless: (1) a local manufacturing facility is established; or (2) sensitive IP is transferred to another pharmaceutical firm with local manufacturing facilities in Indonesia after five years in the market, except for products still under patent protection. The first condition is not possible for many PhRMA member companies, given the structure of their global pharmaceutical supply chains. The second condition poses a serious threat to IP protection and patient safety.
Rather than amend Decree 1010 to mitigate damaging provisions, the MoH created Decree 1799 on December 2010, altering the definition of local manufacturing and introducing the concept of partial manufacture. PhRMA member companies have sought clarification on several vague and conflicting provisions of Decree 1799 since its release. The guidelines for Drug Registration (popularly known as the Brown Book) developed by Food and Drug Monitoring Agency (BPOM), issued in July 2011 and revised in 2013 and 2016, were comprehensively renewed in November 2017; some of the provisions in this latest Brown Book provided leeway for PhRMA member companies to comply with the requirement to locally manufacture imported products within five years of patent expiration. While PhRMA member companies acknowledge the initial steps taken by BPOM to engage in consultations, key concerns remain unresolved with the existing provisions in Decree 1010 and Decree 1799.

PhRMA member companies are also concerned with escalating local content requirements, first established as a result of Presidential Instruction No. 6/2016, as a means to accelerate the development of the biopharmaceutical and medical device industry in Indonesia. Under the regulation, a local content requirement calculation was created to be used as a criterion for government procurement of biopharmaceutical and medical device products. Finally, this trend was further bolstered by Presidential Decree 2/2022, which prioritizes for government procurement products with domestically produced raw materials, specifically those with a local content threshold of at least 25 percent. It is critical that these requirements are not applied in a manner that restricts patient access to innovative medicines in Indonesia and that greater recognition is given to biopharmaceutical innovators for their contribution in bringing innovative therapies to Indonesia. Prioritization to use locally-made products was also emphasized in the recently promulgated 2023 Omnibus Health Law.

Within the 2023 Omnibus Health Law, Articles 327 and 328 explicitly dictate that the government and healthcare facilities – both public and private – must prioritize the procurement and utilization of domestically produced and sourced pharmaceuticals and medical devices. This means both public and private hospitals seeking to purchase drugs in the government’s e-catalogue must prioritize purchasing medicines with a high proportion of local content (minimum 70 percent) before they can buy imported products. This further escalates the aggressive import substitution policy pursued in recent years, which has centered around the imposition of local content requirements as well as the “freezing” of imported products from the public procurement catalogue should local alternatives be available.

PhRMA member companies are concerned about Indonesia’s localization requirements and the lasting harm to market access, IP protection and patient health if left unresolved. PhRMA members encourage the Indonesian government to consult stakeholders, including the private sector, on the possible implications of the implementation of the 2023 Omnibus Health Bill as it is developed, and to ensure that access to innovative therapies for Indonesian patients is not further restricted.
Cost Focused Formulary Decisions

Indonesia’s national formulary (FORNAS) serves as a basis for pharmaceutical reimbursement and public-sector procurement. While Indonesia should be commended for developing guidelines and an online portal (eFORNAS) for listing new medicines on FORNAS, actual listing decisions appear to be primarily based on price and the overall JKN budget. Patients in Indonesia have very limited access to innovative medicines compared to other countries: only nine percent of new medicines launched globally since 2012 have launched in Indonesia compared to an average of 38 percent across all G20 countries.\(^{336}\) Further, only two percent of new medicines launched globally since 2012 are publicly reimbursed by the National Health Insurance (JKN), with patients waiting an average of 71 months for JKN reimbursement.\(^{337}\)

PhRMA encourages FORNAS to consider broader health and economic evidence for listing decisions that improve health outcomes for Indonesian patients, rather than budget impact analysis. Moreover, although products can be added or removed annually, formal updates to the FORNAS only take place every two years. Recent moves to delist and freeze products based on arbitrary standards for cost-effectiveness and localization requirements have raised additional concerns. In addition, the newly issued 2023 Omnibus Health Law gives the government authority to regulate and control the price of drugs and medical devices in the context of securing their accessibility for public health efforts. The Law focuses these authorities on the public sector, but industry remains concerned that these efforts will be applied in the private sector as a means of direct price controls.

Consistent with the Indonesia Government’s guidelines, listing decisions should reflect all evidence submitted, including clinical evidence demonstrating the product’s safety and efficacy. PhRMA and its member companies encourage the Indonesian Government to take a more holistic approach to HTA (e.g., multiple criteria decision analysis) for procuring medicines and to establish a more transparent and credible decision-making process. PhRMA also encourages FORNAS to consider more flexible, innovative contracting models to increase patient access to medicines.

Presidential Regulation No. 12/2021 and its implementing regulations simplify the listing process of pharmaceutical products in the government procurement catalogue, allowing for the inclusion of any FORNAS-listed drug priced below the ceilings set by the MoH. However, price negotiation is no longer conducted by the government, but individual health care facilities now have the authority to negotiate prices with suppliers. This mechanism introduces a great deal of uncertainty surrounding the price and supply of pharmaceutical products, potentially leading to shortages and reduced patient access. It could also prompt questionable business practices between certain purchasers and suppliers. PhRMA and its member companies encourage the government to issue

\(^{337}\) Id.
technical guidelines to ensure catalogue-listed products meet certain standards (i.e., product quality and supplier capacity) and await further clarity on the pricing of medicines.

**Mandatory Halal Certification**

The 2020 Omnibus Job Creation Law partly amended Indonesia’s 2014 Halal Product Assurance Law, which mandates Halal certification and labeling for food and beverages, medicines, cosmetics, chemical products, biological products and genetically-engineered products. The Law establishes a new Halal certification authority called the Halal Product Assurance Organizing Agency (BPJPH) and requires pharmaceutical firms to hire a Halal specialist and disclose sensitive product formulas to the new Halal authority. The revisions to the Halal Law also streamline the process of halal certification, simplify the certification renewal process and provide clearer timelines.

In February 2021, the government issued Regulation No 39/2021 to implement Halal-related provisions of the Omnibus Job Creation Law, replacing Regulation No 31/2019, which implemented the 2014 Halal Law. The 2021 Regulation stipulates a phased implementation of the law. Manufacturers will be required to provide halal certification for over-the-counter drugs by October 2029 and for prescription drugs by October 2034. The Presidential Regulation on Halal Certification for Biological Products and Medical Devices was issued earlier this year, mandating Halal certification for biological products and vaccines by 2039.

The new regulation better aligns labeling requirements for non-Halal drugs and biological products through packaging differentiation. BPOM is currently in the process of adjusting its existing labeling requirements to reflect this change and PhRMA welcomes clear guidance to the pharmaceutical industry for compliance. Furthermore, BPJPH acknowledged the possibility of a mutual recognition agreement with foreign Halal agencies giving the possibility that imported products that already have Halal certification be registered as Halal in Indonesia. Challenges in assessment standard harmonization remain between Indonesia and many other countries.

PhRMA member companies urge the government to ensure that the stipulations and requirements for Halal certification take into consideration and align with the biopharmaceutical industry’s rigorous standards and practices already in place that ensure safety, efficacy and good manufacturing processes. Further, while PhRMA’s member companies recognize and support the religious and cultural sensitivities of all Indonesians, it is critical that these regulations do not hinder patient access to the medicines they need.

**Counterfeit Medicines**

Although PhRMA’s member companies welcome Indonesia’s ongoing efforts to promote the use of safe medicines, there is an urgent need to expand national enforcement efforts. New leadership at BPOM have focused their efforts on combatting counterfeit food and medicine products, but the budget and resources for this effort
remains inadequate. Increasing and enforcing the penalties for criminals caught manufacturing, supplying, or selling counterfeit pharmaceuticals as well as unsafe medicines will greatly assist Indonesia’s efforts to reduce the harmful impact of counterfeit medicines.

Research conducted by Masyarakat Indonesia Anti-Pemalsuan (MIAP), Indonesia’s anti-counterfeiting society, suggests that losses incurred by the state as a result of counterfeiting continue to rise each year. Greater collaboration and government initiatives, such as a nationwide campaign and devoted budget to combat counterfeit products, should be intensified to ensure the health and safety of Indonesian patients.

Hence, PhRMA’s member companies support Indonesia’s ongoing legislation agenda for finishing the Drug and Food Supervision Bill in 2023 as a legal basis for creating a stronger drug administrator and drug supervision process.
A decade ago, Japan made important reforms in the areas of drug pricing, evaluation and approval, and vaccine policy that made its system more transparent, more supportive of innovation and more conducive to biopharmaceutical research and development. These reforms reduced regulatory delays and Japan’s well-known “drug lag” in which innovative medicines were not launched in a timely manner. However, the policy and commercial environment has significantly deteriorated since 2016. The Japanese Government has pursued, and the Central Social Insurance Medical Council (Chuikyo) has approved, more than 50 changes to pricing rules, repeated price cuts to patented medicines and other actions related to intellectual property (IP) that have put Japan's biopharmaceutical innovation ecosystem at a competitive disadvantage. Japan is now viewed as a negative growth market and life sciences investment continues to decline in contrast to the positive global trend. The result has been a decrease in Japan’s share of the early-stage pipeline, stagnation in new clinical trials and a return of the “drug lag” in which innovative medicines to treat unmet medical needs are increasingly not launched in Japan in a timely manner – or a “drug loss” in which they are not launched at all. Recent Japanese Government policy documents including the Ministry of Health, Labor and Welfare (MHLW) Pharmaceutical Industry Vision, MHLW Expert Panel on Comprehensive Measures to Achieve a Rapid and Stable Supply of Pharmaceuticals, and Basic Policy on Economic and Fiscal Management and Reform (Honebuto no hōshin) identify the life sciences as a key sector and made important policy recommendations to reverse these negative trends. PhRMA and its member companies are committed to working with Japan to find policy solutions for a thriving biopharmaceutical innovation ecosystem that fosters science, economic growth and timely access to new medicines for Japanese patients.

Key Issues of Concern:

- **Degradation of the Price Maintenance Premium (PMP) system**: Japan announced several new drug pricing policies in December 2017 that ran counter to the government’s pledge to appropriately value innovation and foster innovation in Japan. Among these, PhRMA member companies are particularly concerned by the dramatic reduction in the number of patented medicines that are recognized as “innovative” for the purpose of qualifying for the PMP. More specifically, Japan’s new product criteria are non-science based and unique in the world, and the new company criteria contain elements that discriminate against foreign companies and smaller companies. Unfortunately, despite industry proposals to improve the criteria, the Japanese Government made only minor changes when it undertook a review of the outcome of the new rules in 2019 and 2021. The PMP system continues to severely undervalue U.S. IP and the eligibility criteria were not adequately revised, seriously calling into question Japan’s commitment to fair and non-discriminatory policies.

- **Repeated price cuts to patented medicines**: Another issue of serious concern is the move in 2021 from a system of biennial price cuts to an annual system.
Effective April 1, 2023, annual cuts apply to all medicines with more than a 4.375 percent difference (yakka-sa) between the government reimbursement price and the surveyed wholesaler price to providers (e.g., hospitals, clinics and retail pharmacies). The scope of products subject to annual price cuts has exceeded any option put forward by the Ministry of Health, Labour and Welfare (MHLW) for discussion at the Chuikyo in 2020 and was never shared with the industry prior to its formal announcement. In 2023, the reduction in biopharmaceutical expenditure generated by the price cuts to these products is estimated to be 310 billion yen. The combined impact of the reduction in the scope of PMP-eligible products and annual price cuts on patented medicines severely undervalues U.S. IP and makes Japan an outlier among leading economies.

- **Overuse of re-pricing rules for patented medicines:** Over the past few years, new or strengthened re-pricing rules have been applied in Japan. For example, in 2016 the huge seller re-pricing rule was introduced, starting in 2018 some of the re-pricing rules have been applied on a quarterly basis instead of a biennial basis and in 2020 a special rule for indication change re-pricing was introduced. Such frequent changes and tightening of the re-pricing rules significantly undervalue innovation, reduce the predictability of drug prices and reduce the incentive to invest in R&D for additional indications. PhRMA believes that these complex re-pricing rules need to be restructured by reexamining their requirements and impacts or otherwise abolished.

- **Use of health technology assessment (HTA) to devalue innovation:** The Japanese Government implemented a new HTA system in April 2019 after cutting the prices of several leading innovative medicines that were subject to a cost-effectiveness assessment pilot program in 2018. The new HTA system is severely inconsistent with international norms, focusing solely on cost-effectiveness thresholds and ignoring many aspects of a product’s value to patients and the health care system. Further, the system has been developed with few meaningful opportunities for the innovative biopharmaceutical industry and other stakeholders to provide input. By September 2023, 20 of 26 innovative medicines subject to assessments have had their prices cut. PhRMA and other industry associations provided views on the operational challenges of the HTA system during Chuikyo hearings, but most of these challenges have not yet been addressed by the government. PhRMA remains concerned about the Japanese Government’s plan to potentially expand the price adjustment range and scope of the HTA system to reimbursement listing, which would delay market access contrary to previous U.S.-Japan trade understandings and significantly undervalue U.S. innovation. There remains a strong need to enhance the transparency and scientific basis of how the HTA system operates and makes decisions.

- **Lack of transparency and predictability in government decision-making:** As the Japanese Government developed detailed plans to carry out the drug pricing reform initiative over the past several years, there were few formal attempts by the decision-making bodies to seek input from stakeholders, including the innovative
pharmaceutical industry. For example, despite the key policy issues being debated by the government since 2017, the Japanese Government has not once released the proposed new rules for public comment. In addition, the industry has been invited to testify before the Chuikyo on limited occasions and the time allotted for testimony has typically been rigidly limited. Frequently, no government proposal is put forward in advance of the Chuikyo meeting on which the industry could comment. Except for the formal hearings at which industry is invited to testify, industry representatives are only able to attend Chuikyo meetings as observers. Even after rules are announced, PhRMA member companies are often uncertain about how they will be applied or experience their capricious application. Moving forward, PhRMA and its member companies request more regular and meaningful opportunities to provide input regarding the development of further reforms to Japan’s pricing and reimbursement rules.

- **Regulatory policies**: The Japanese Government continues to seek to accelerate and expand drug development in Japan, ensure that patients have prompt access to the newest drugs and support the pharmaceutical industry as a key driver of economic growth in Japan. To achieve these goals, more flexible approaches are needed in the approval and regulatory process to promote simultaneous global development. This includes (1) acceptance of a pooled region approach for clinical data as well as Japanese sample size allotments for multi-regional clinical trials as described in the ICH E17 (MRCT) guideline, (2) increase in the number of drugs designated and approved early under the Sakigake designation, the conditional early approval systems and the orphan designation, and (3) the development of a new innovative expedited approval system that focuses on the clinical benefit-risk assessment of a new drug itself.

- **Vaccines and prophylaxis measures**: In order to ensure that Japanese citizens have access to the world’s most innovative preventive technologies, Japan needs to execute the National Vaccine Plan and to develop a system that provides for permanent and full funding of all recommended vaccines and other preventive medicines such as pre-and post-exposure prophylaxis for infectious diseases, predictability in the evaluation and adoption of new vaccines and other preventive medicines into the recommended (i.e., funded) schedule and a data-driven science-based process to determine the benefits of vaccines and other preventive medicines and to manage adverse events.

- **Patent term restoration (PTR)**: PhRMA members appreciate Japan’s PTR laws, as they provide term extensions for subsequent marketing approvals for additional indications or medical uses, or modifications of previously approved products. The Japanese law acknowledges the value that additional approvals can provide to patients. However, the laws as currently interpreted by the Japanese Patent Office (JPO) often result in extensions for subsequent marketing approvals which are shorter in term than the extensions for the original approval and can thus act as a disincentive to conduct research on additional medical uses and indications, including new formulations for an approved product.
- **Effective patent enforcement**: Actions by the MHLW to approve generic versions of an innovative product during ongoing litigation raises concerns for industry as to Japan’s commitment to effectively enforce patents. Further, while injunctive relief is typically available in Japan, such relief can take months to secure, thereby frustrating the ability of the innovator to seek an injunction before potentially infringing products are allowed to enter the market.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Market Access**

Drug pricing policies strongly influence biopharmaceutical R&D investment in Japan and patient access to innovative medicines. PhRMA supports a system in which new innovative medicines receive a reimbursed price at launch that appropriately recognizes value, maintain prices during the patent period and significantly reduce prices at loss of exclusivity. However, when policies disincentivize investment and undermine early access – as Japan has pursued in recent years – it leads to fewer clinical trials, fewer drugs being brought to the market and fewer patients able to access life-saving medicines. Overall, while 85 percent of new medicines launched globally since 2012 are available in the United States, just 51 percent are available in Japan, with Japanese patients waiting an average of 15 months from global first launch for the fewer medicines that become available.\(^{338}\)

**Degradation of the Price Maintenance Premium System**

The introduction of the PMP in 2010 as a two-year pilot project (followed by its renewal in 2012, 2014 and 2016), has been a critical factor in promoting innovation in Japan, eliminating the drug lag, ensuring that Japanese patients have timely access to innovative medicines and ensuring that U.S. and other innovative products were appropriately valued. This system has demonstrably led to increased R&D and applications and approvals for new drugs and indications, even though the net benefit of the price maintenance premium has been somewhat reduced by the 80 percent ceiling on the premium under certain circumstances and the continued use of the market expansion and other re-pricing rules. Investment in biopharmaceutical innovation is a long-term endeavor, such that any unpredictability in the PMP could lead to slower development or launch of new medicines.

However, under the government pricing reforms implemented in April 2018, products eligible to receive the PMP were restricted to those that either: (1) received a price premium at launch or post-launch; (2) meet certain criteria for new mechanisms of action; (3) are second- or third-in-class and launched within three years of a comparator product in the above groups; (4) received an orphan designation; (5) were developed in response to an open request from MHLW; (6) received a Sakigake designation; (7)

---

obtained additional indications with new mechanisms of action that meet MHLW’s innovativeness and utility criteria; or (8) address antimicrobial resistance. Particularly for the third set of products, the current PMP system equates innovativeness with the speed and the order in which products launch. PhRMA is opposed to such a non-science-based evaluation of innovation and notes that several globally leading U.S. products have been deemed non-innovative under the new criteria and stripped of their PMP eligibility. This clearly demonstrates that the current system fails to appropriately value U.S. innovation. Currently, approximately 50 percent of patented medicines no longer qualify for the PMP.

In addition to the product eligibility changes, companies with eligible products were ranked and sorted into three tiers based on: (1) the number of phase 2+ clinical trials conducted in Japan; (2) the number of new products launched in Japan within the past five years; (3) the number of innovative new products launched in Japan within the past five years; (4) the number of therapeutic drugs for drug-resistant bacteria launched in Japan within the past five years; (5) the number of therapeutic drugs for COVID-19 launched in Japan within the past five years; (6) the number of new products under development in response to open requests from MHLW; (7) the number of new products approved in response to open requests from MHLW; (8) the number of products with a Sakigake designation; and (9) the number of products with a special purpose drug designation. The number of companies eligible for Tier 1 status was limited to 25 percent but not exceeding 30 percent, even if companies have the same rank. All eligible products marketed by Tier 1 companies were awarded the full amount of the PMP. Eligible products marketed by Tier 2 or Tier 3 companies were awarded 90 percent or 80 percent of the PMP, respectively.

While the Japanese Government undertook a review of the new PMP rules and outcomes in 2019, only minor changes were made despite industry proposals to address concerns. PhRMA believes that the product criteria remain non-science-based and that limiting the number of companies eligible for the full PMP cannot be a true test of innovativeness. Further, the company criteria continue to inappropriately favor larger companies and specific elements are inherently biased towards domestic companies, seriously calling into question Japan’s commitment to fair and non-discriminatory policies pursuant to its WTO obligations. In December 2021, a positive change was announced that will allow ineligible products to qualify for the PMP after approval of an indication that would have met the criteria for a price-premium at launch. However, significant further revisions to the PMP system are urgently needed to ensure that it is science-based, fairly evaluates innovation and promotes biopharmaceutical R&D.

Repeated Price Cuts to Patented Medicines

In December 2020, the Japanese Government announced a new rule that moved from the current system of biennial price cuts to an annual system, applying annual price cuts effective April 1, 2021, to all medicines with more than a 5 percent difference (yakka-sa) between the government reimbursement price and the surveyed wholesaler price to purchasers (e.g., hospitals, clinics and retail pharmacies). In 2021, this included 69 percent of all medicines (more than 90 percent by value) and 59 percent of patented
medicines. In December 2022, the Japanese Government announced price cuts effective April 1, 2023, based on a *yakka*-sa threshold of only 4.375 percent. However, MHLW will also implement an exceptional measure to increase the amount of the PMP for PMP-eligible products that would otherwise face price cuts due to the PMP company criteria (e.g., for Tier 2 or Tier 3 companies) or *yakka*-sa, such that the revised prices of PMP-eligible products will be “comparable” to pre-revision prices. In 2023, the reduction in biopharmaceutical expenditure generated from these price cuts is estimated to be 310 billion yen. The combined impact of the reduction in the scope of PMP-eligible products and annual price cuts to patented medicines severely undervalues U.S. IP and makes Japan an outlier among leading economies.

The scope of products subject to annual price cuts has exceeded any policy option put forward by MHLW for discussion at the Chuikyo in 2020 and was never shared with the industry or other stakeholders prior to its formal announcement. Further, the scope of the revision marked a major departure from previous Japanese Government policy decisions that have been publicly announced and codified in various documents, including the 2016 four-ministers agreement which stated that only products with a “large” *yakka*-sa would be subject to the off-year price revision as opposed to a *yakka*-sa threshold capturing most products. Finally, the decision seemed to ignore prior discussions at the Chuikyo, during which several health care stakeholder groups (e.g., physicians and pharmacists) opposed implementing the price revision on a broad range of products. PhRMA requests that annual price revisions be reconsidered during future policy reforms.

Further, the current market-price-based revision system, which is unique to Japan, triggers a delay or a loss in launching innovative products in Japan. To address this, PhRMA proposes transitioning to a new system that allows prices to be maintained during the patented term.

### Overuse of Re-pricing Rules for Patented Medicines

Over the past few years, new or strengthened re-pricing rules have been applied in Japan. For example, in 2016 the huge seller re-pricing rule was introduced, starting in 2018 some of the re-pricing rules have been applied on a quarterly basis instead of a biennial basis and in 2020 a special rule for indication change re-pricing was introduced. Such frequent changes and tightening of the re-pricing rules significantly undervalue innovation, reduce the predictability of drug prices and reduce the incentive to invest in R&D for additional indications. PhRMA believes that these complex re-pricing rules need to be restructured by reexamining their requirements and impacts. In particular, the spillover rule, which applies price cuts to pharmacologically similar products of other products that have undergone significant market expansion, disincentivizes innovation and increases unpredictability for biopharmaceutical companies seeking to launch new indications in Japan, and should be abolished.
Use of Health Technology Assessment to Devalue Innovation

PhRMA supports the use of sound evidence to guide decisions about allocating health care resources. However, deficient HTA processes can run counter to their key objectives and risk denying or delaying patients’ appropriate access to medical technologies, inefficiently allocating resources, constraining clinical freedom and harming innovation through unreasonable cost-containment methods.

In April 2019, the Japanese Government implemented a new HTA system after cutting the prices of several leading innovative medicines that were subject to an ongoing cost-effectiveness assessment pilot program in 2018. The new HTA system is severely inconsistent with international norms in both methods and process. With respect to methods, the system is solely focused on cutting prices based on a poorly-justified incremental cost-effectiveness threshold that ignores the benefits that innovative medicines bring to Japanese patients, the health care system and society. Moreover, the process does not include input from multiple stakeholders, including patients and subject matter experts. By primarily serving to reduce the price premiums granted at launch for innovativeness and clinical benefit, the adopted approach perversely acts to remove the incentives for medicines that deliver better patient outcomes. There remains a strong need to enhance the transparency of the process, foster science-based discussions on product value and develop sound guidelines that can serve as a basis for analysis.

Furthermore, the system was developed without meaningful opportunities for interested stakeholders, including the innovative industry, to provide input. By September 2023, 20 of 26 innovative medicines subject to assessments have had their prices cut. PhRMA and other industry associations provided views on the operational challenges of the HTA system during Chuikyo hearings, but most of these challenges have not yet been addressed by the government. PhRMA remains concerned about the Japanese Government’s plan to potentially expand the price adjustment range and scope of the HTA system to reimbursement listing. Such a new policy would create further market access barriers for U.S. biopharmaceutical products and almost certainly delay patient access to innovative medicines and worsen the drug lag and drug loss, contrary to previous U.S.-Japan trade understandings. There remains a strong need to enhance the transparency and scientific basis of how the HTA system operates and makes decisions to ensure continued patient access to innovations.

Lack of Transparency and Predictability in Government Decision-Making

As the Japanese Government developed detailed plans to carry out the drug pricing reform initiative over the past several years, there were few formal attempts by the decision-making bodies to seek input from stakeholders, including the innovative biopharmaceutical industry. For example, despite the key policy issues being debated by the government since 2017, the Japanese Government has not once released the proposed new rules for public comment. In addition, the industry has been invited to testify before the Chuikyo on limited occasions and the time allotted for testimony has typically been rigidly limited and there has frequently been no government proposal put forward in
advance on which the industry could comment. Except for the formal hearings at which industry is invited to testify, industry representatives are only able to attend Chuikyo meetings as observers.

In addition to the failure to provide adequate meaningful opportunities for interested stakeholders, including PhRMA member companies, to provide input into the development of these policies, the Japanese Government has also failed to publish clear guidelines on how some of the new policies will be interpreted and implemented. Even after rules are announced, PhRMA member companies experience sudden and non-transparent application of rules to their products and increasingly in a way that is contrary to their stated intent. This lack of transparency and frequent changes to the rules for setting prices at reimbursement listing, re-pricing of existing products and other key policies have made the Japanese market highly unpredictable and lacking in procedural fairness.

PhRMA appreciates that a new MHLW Expert Panel on Comprehensive Measures to Achieve a Rapid and Stable Supply of Pharmaceuticals established in August 2022 has stimulated discussion on drug pricing and distribution policies, and that PhRMA had an opportunity to present its positions. Moving forward, PhRMA and its member companies request that Japan implement more transparent decision-making processes that include regular and meaningful opportunities to provide input regarding the development of further reforms to Japan’s pricing and reimbursement rules. It is necessary to create an environment that enables industry to be involved in the drug pricing policy process, such as Chuikyo, as one of the decision makers on an equal footing with other stakeholders. We urge the U.S. Government to engage with their counterparts in the Japanese Government in an early timeframe to ensure that Japan provides the appropriate transparency and due process – including the opportunity for meaningful consultations with industry and other interested stakeholders – before Japan finalizes proposed laws, regulations and procedures concerning how medicines are priced and reimbursed.

Other Government Policies of Concern

The introduction of optimal use guidelines and repeated changes to various re-pricing rules have been imposed suddenly and without meaningful stakeholder involvement. These actions by the Japanese Government reduce the predictability and transparency of the drug pricing system in Japan and threaten to undervalue innovative U.S. products. Reform of the pricing system should be done via a fully fair and transparent system and should avoid reactive short-term, ad hoc re-pricing mechanisms that fail to appropriately value innovation. The re-pricing rules should be revisited in their entirety and the effect of optimal use guidelines on the health insurance system should be strictly limited so that patients’ early access to innovative medicines is ensured.

In April 2022, a new rule was implemented for products with a potentially large market size. Under the rule, the pricing method of such products are discussed at Chuikyo prior to the decision at the Drug Pricing Organization. Extensive use of such ad-hoc and
arbitrary methods in pricing and reimbursement decisions undermines the predictability of the market and should be avoided.

The industry also recommends that other unfair or unreasonable price-setting rules in Japan’s drug pricing and reimbursement system be corrected as follows:

1. **Reward for Innovative Additional Indications**: The MHLW should consider not only the strengthening of the re-pricing rules, but also the mechanism by which the reward for innovative additional indications can be reflected in the drug price. According to the current rules, when pediatric or orphan indications are added, a corrective premium can be granted at the time of re-pricing. In the same manner, when adding highly innovative indications, corrective premiums should be added at the time of re-pricing to moderate the reduction rate of re-pricing.

2. **Expand Criteria of Innovation and Usefulness Premiums**: Under the existing pricing method for new drugs, certain premiums may be granted where the drug shows greater innovation or usefulness than its comparator or existing treatments. Unfortunately, most new drugs eligible for a price premium still receive no, or relatively low, premiums. One challenge is that the quantitative criteria used to determine the magnitude of the premium was developed in 2014 based on prior pricing cases and need to be updated. For example, the criteria lack a scheme in which the magnitude of the premium can be set in line with the degree of improvement in product effectiveness. Moreover, product usefulness from the patient, family or societal perspective, such as improvement in quality of life, avoidance of productivity loss or reduced burden for family caregivers, should be explicitly included.

3. **Expand Scope of Evidence for Innovation and Usefulness Premiums**: Another challenge is that even if evidence of usefulness is available, a premium is often not awarded when the supporting evidence is not evaluated in the Pharmaceuticals and Medical Devices Agency (PMDA) review report. PhRMA believes that even if such evidence is not included in the PMDA review report, it should be accepted for determining whether a premium is applied as long as the evidence can withstand scientific and objective evaluation.

**Pharmaceutical Regulatory Reform and Related Issues**

1. **Simultaneous Global Development of Drugs**

PhRMA welcomes the government’s continued support of simultaneous global development and efforts to promote multiregional clinical trials (MRCT) in order to expedite the availability of life-saving and life-enhancing drugs to patients. Therefore:

- PhRMA encourages the government to increase its global and regional regulatory harmonization efforts, especially to include the reduction of market-specific requirements that can delay simultaneous global development. In
particular, PhRMA highly appreciates the MHLW and PMDA’s recent efforts to be more flexible in regulatory requirements and processes for promoting simultaneous global development. These efforts include the acceptance of a pooled region approach for clinical data and Japanese sample size allotments as described in the ICH E17 (MRCT) guideline, the need for Japanese Phase 1 study before the MRCT starts and regular revisions working collaboratively with academia and industry.

- PhRMA encourages harmonization of the following CMC data requirements: (1) globally aligned science- and risk-based approach for developing commercial products; (2) flexibility of requirements for CMC data for expedited approval pathways; (3) harmonization of compendial; and (4) CMC data requirements for biological and other new modality products.

- PhRMA welcomes the enactment of the revised Pharmaceuticals and Medical Devices Law in May 2022 to ease regulatory approval requirements for therapeutic drugs and vaccines in certain emergency situations.

- PhRMA also welcomes the establishment of the study group on pharmaceutical regulations to strengthen drug discovery capabilities and ensure stable supplies in Japan.

2. Improved Efficiencies at PMDA

PhRMA appreciates the significant efforts made by PMDA to meet its review performance goals for standard and priority files, as well as its efforts to meet the demands for consultations in an expeditious manner. PhRMA values its participation in PMDA’s Working Groups on consultations and review practices. PhRMA looks forward to continuing its active participation in these groups and hopes that its participation will lead to the development and implementation of concrete process improvements that will aid PMDA in continuing to meet its performance goals.

3. Revision of Post-Approval Change Process and Reduction in Review Times

PhRMA appreciates the opportunity to discuss Japan’s post-approval changes to manufacturing and control processes and will continue to provide constructive recommendations based on global best practices to align the Japanese system with those used by other major regulatory agencies. PhRMA further appreciates the efforts to reduce the review times of partial change applications and encourages PMDA to include biologic and new modality products, especially those arising from recombinant technology, in those review targets.

4. Risk Management System

Reform of the pharmacovigilance system including risk management assessments is an important undertaking by the government and PhRMA has supported the
government’s preparation and implementation of its Risk Management System (i.e., Risk Management Plan (RMP)). The RMP went into effect on April 1, 2013, in Japan. While global standardization of a pharmacovigilance system is challenging, risk minimization in an effective and efficient manner is critical. PhRMA looks forward to continuing to engage collaboratively with academia and regulatory authorities on the implementation of this concept and process to collect and provide better post-marketing information for use in medical settings.

5. AMED – the Japan Agency for Medical Research and Development

PhRMA welcomes the creation of AMED in April 2015, as a new agency designed to enhance translational research, to support drug development from the laboratory through the clinical development process and into the marketplace, and to coordinate the national government’s health care research and development budgets now assigned to different ministries without strategic coordination. PhRMA emphasizes the need to ensure that AMED’s programs will be open to all pharmaceutical companies, whether Japanese or foreign based.

6. Expedited Approval Systems

PhRMA welcomes the implementation of the Sakigake program and the conditional early approval system to encourage the early evaluation and approval of important new medicines. To avoid worsening the drug lag and drug loss in Japan, PhRMA encourages the government to adopt a flexible approach to the acceptance requirements for applications to increase the number of medicines designated and approved early under the Sakigake designation, the conditional early approval systems and the orphan designation. Currently, the number of medicines qualifying for the Sakigake designation, and the conditional early approval system remains very low. For example, in 2022, 34 products in the United States received Breakthrough Therapy designation, 13 products in the European Union received PRIME designations, and no products in Japan received Sakigake designations. Therefore, a new expedited approval system should be developed that focuses solely on the safety and efficacy of a new medicine rather than other factors such as the order of development and launch in the world. The new system should also allow flexibility in regulatory submission documents. This will ensure Japan’s expedited approval pathways are equivalent to similar systems in the United States and the European Union. The number and the timing of the orphan designation are also concerns. Finally, PhRMA appreciates the enactment of the new emergency approval system that is not contingent on prior approvals in other countries as such a system will help improved pandemic preparedness.

Preventive Health Care and Vaccines

Prevention plays a critical role in protecting a population’s health and well-being. However, more effective and efficient awareness initiatives aimed at the public should be undertaken. Vaccines are particularly important in reducing disease burden and medical expenses, as well as improving the quality of life. The past several years have seen some
important changes, including a revision in 2013 of the Preventive Vaccination Law, implementation of a National Vaccine Plan and adoption of six vaccines into the National Immunization Program (NIP). Although the Japanese Government intended to revise the Law in 2021, the COVID-19 pandemic has delayed this timeline, which remains unclear. In addition, other preventive medicines for pre-exposure prophylaxis and post-exposure prophylaxis for infectious diseases have not been fully licensed and reimbursed in Japan despite solid evidence of clinical and health system benefits.

The following issues require attention:

1. Increasing priority given to support investments in “Made in Japan” products

   COVID-19 has revealed weaknesses in the Japanese system and the government’s Strategy for the Strengthening of Vaccine Development and Manufacturing adopted in June 2021 as well as recent government discussions point to a growing trend by the Japanese government to support investments in “Made in Japan” products. The rapid development and deployment of COVID-19 vaccines was made possible because of global partnerships and consistent investments in research and development, manufacturing, and marketing. In order for Japan to promptly develop vaccines that can be used widely, it must participate in international networks for vaccine development through an open global ecosystem instead of relying solely on the research and development of domestic companies and academia.

2. Lack of predictability and timeliness in the NIP decision-making process at MHLW

   The current recommendation process is significantly nontransparent as it relates to the evaluation and adoption of new vaccines into the NIP. As a result, vaccine manufacturers lack crucial information as to what data are necessary to receive a national recommendation and when the data should be presented. Furthermore, the vaccination decision-making process is unclear. While a Vaccination Policy Committee under MHLW exists, the timeline of a new vaccine’s evaluation, the criteria by which it is evaluated and the committee’s ability to change vaccination policy, as well as how the necessary funding is secured, are not transparent and lack predictability. For example, in October 2019, MHLW’s Vaccination Policy Committee made the decision to include rotavirus vaccines into the NIP from October 2020. This decision came eight years after regulatory approval in Japan. It is essential that decisions related to vaccine access and equity are timely and based on science. This is especially important for inclusion in the NIP and in any evaluation of adverse events.

3. Lack of international regulatory harmonization

   Japan used to have a “vaccine gap” with fewer nationally recommended vaccines due to the lack of harmonization between domestic and international regulations. In May 2020, the Guideline for Clinical Trials of Preventive Vaccines and Guideline for Nonclinical Trials of Preventive Vaccines was published and a forum was created between regulatory authorities and industry associations in Japan to discuss challenges in vaccine
development. A positive outcome from this forum was the removal of the abnormal toxicity denial test and harmonization of quality standards, helping to close the development gap for single component vaccines. However, harmonization of regulatory and quality standards for combination vaccines remains a significant problem, raising continued challenges for the introduction of foreign-made vaccines in Japan.

4. Lack of broad recognition from Japanese citizens of the value of vaccines

Although the revision of the Preventive Vaccination Law provided for full national funding for most recommended vaccines, the changes did not apply to several approved vaccines. The value of vaccines should be recognized by a funding system and NIP process that incentivize manufacturers to develop and bring new vaccines to Japan as quickly as possible, together with a nationwide program to educate citizens about the importance of vaccinations. While the COVID-19 pandemic has raised public interest in vaccines and disease prevention, definitive action by the Japanese government is needed to educate citizens about the importance of life-course immunization, including “voluntary vaccines” that are not in the scope of the NIP.

Intellectual Property

Patent Term Restoration

Japan’s PTR system permits term extensions for subsequent approvals for a product, such as for a new use of a previously approved product. PhRMA members appreciate Japan’s PTR laws, as they acknowledge the value that additional approvals can provide to patients. However, PhRMA urges the JPO to review its practices in granting PTR for subsequent approvals, to take into account the full regulatory review period in determining the length of any extensions. In particular, the current JPO practice, which provides an extension period based only on what is considered “necessary testing” for the subsequent approval, often results in extension periods for subsequent approvals that are shorter than the extension period of the first approval. As a result, the current practice can act as a disincentive to conduct research on additional medical uses and indications, including new formulations for an approved product.

Effective Patent Enforcement

PhRMA’s members value the highly predictable and reliable IP protections provided in Japan. Predictable and reliable IP protections are particularly important to our sector given the significant resources required to develop innovative medicines, as well as the inherently risky nature of developing new medicines which must not only be developed but also must be shown to be safe and effective for treatment of a particular disease or condition. Less than 12 percent of all potential new drugs entering clinical trials

However, actions by the MHLW have undermined the predictability of Japanese IP protections. Specifically, while MHLW appropriately takes the position that it should not arbitrate patent disputes, it essentially did so when it unilaterally determined that it was appropriate to approve multiple generic versions of an innovative product even though the JPO had upheld some claims of a patent directed to the innovative product. In other words, MHLW took it upon itself to interpret whether the upheld patent claims covered the innovative product.

The innovative manufacturer in this instance has initiated patent infringement suits against each of the approved generics. That, however, has served to highlight another deficiency in Japan's patent enforcement system. Specifically, now that the MHLW has approved these generics versions, those products were added to the National Health Insurance price list, thereby enabling potentially infringing products to enter the market. While injunctive relief is typically available in Japan, such relief can take months to secure, thereby frustrating the ability of the innovator to seek an injunction before potentially infringing products were allowed to enter the market. As a result, the manufacturers of each of the approved generics have been put in the position of having to decide whether to launch at risk despite the ongoing litigation. In short, this situation creates significant uncertainty for innovators and generic manufacturers alike, and could ultimately result in products being prescribed to Japanese patients that ultimately have to be withdrawn from the market based on the outcome of the pending litigation. It is exactly this uncertainty that well-functioning and effective patent enforcement systems are designed to avoid.
KOREA

PhRMA and its member companies remain highly concerned with several market access and intellectual property (IP) issues in Korea. Korea’s drug pricing policies severely devalue U.S. IP and favor Korea’s own pharmaceutical industry at the expense of U.S. companies. As a result, America’s cutting-edge R&D and manufacturing sectors are losing out. The consequence is fewer U.S. jobs, fewer U.S. exports and fewer new medicines for patients worldwide. Korea’s pricing practices are inconsistent with its commitments under the U.S.-Korea Free Trade Agreement (KORUS). PhRMA stands ready to work with the U.S. and Korean Government to secure amendments to Korea’s pricing and reimbursement policies consistent with Korea’s broader KORUS obligations. The innovative biopharmaceutical industry is also closely monitoring proposals to revamp regulatory data protection in Korea as well as legislation that is due to go into effect in November that will allow the Korean Government to seek “market-size” damages from innovators that pursue unsuccessful patent claims, which could discourage innovators legitimately seeking to enforce their granted patents.

Key Issues of Concern:

- **Impermissible government pricing and reimbursement policies**: On multiple levels, Korea’s pricing policies contravene its KORUS commitments and negatively impact the rights of U.S. innovators. Korea’s Health Insurance Review and Assessment Service (HIRA) often disregards evidence of clinical benefit and values innovative medicines using an unreasonably low and outdated cost-effectiveness threshold that has declined in real terms over time. Rather than updating this threshold and adopting more appropriate assessment methods, HIRA announced in September 2021 that it would instead use “past assessment results,” thereby continuing the use of outdated thresholds and limiting transparency and predictability in the assessment process. For medicines not subject to the cost-effectiveness threshold, HIRA expanded the number of countries from seven to eight that it could use to recommend the lowest international price. Following HIRA’s review and recommendations, the National Health Insurance Service (NHIS) can also require additional concessions (e.g., risk-sharing agreements) as a condition of NHIS reimbursement and impose excessive and repeated price cuts even if HIRA has already deemed these medicines to be cost-effective. As a result, Korea’s government-set prices are among the lowest in the OECD. Combined, these price controls constitute a failure to “appropriately recognize the value of the patented pharmaceutical product,” in violation of KORUS Article 5.2(b).

- **Lack of transparency, predictability and due process**: Compounding these challenges, Korea also does not provide meaningful transparency and due process for companies that apply for reimbursement, contrary to Korea’s commitments under KORUS Article 5.3. Applicants are often not provided with a satisfactorily informative written basis for evaluations and decisions by HIRA subcommittees and Korea has never honored its commitment in KORUS Article 5.3(5)(e) and the
side letter thereto, to make available an effective independent review mechanism relating to medicine reimbursement.

- **Discriminatory Innovative Pharmaceutical Company (IPC) accreditation:** The Ministry of Health and Welfare (MoHW) designates certain companies as IPCs, which receive tax credits, R&D support and more favorable drug pricing. However, the current accreditation criteria lack transparency and discriminate against U.S. and other foreign innovators by requiring domestic investments to prove “innovativeness.” As of September 2023, only 3 of 47 designated IPCs are non-Korean biopharmaceutical companies. PhRMA is concerned that this policy violates national treatment obligations and the spirit of KORUS Article 5.1.

- **Issues with patent term extension (PTE):** While Korea has implemented PTE, there are three significant issues. First, the PTE calculation should include all relevant essential clinical trials used for the approval of the Korean product, including international clinical trials that are submitted as a part of the Korean dossier for approval of the product. Failure to do so has a discriminatory effect on companies outside Korea that conduct necessary trials, on which the Korean MoHW relies in approving the drug, outside of Korea. Second, there is a lack of due process in the PTE procedures. If the Patent Office determines a certain duration of PTE that is less than the full amount originally requested by the patentee and the patentee challenges that determination and subsequently loses the challenge, no PTE is granted; even the duration previously determined by the Patent Office is lost. This all-or-nothing approach significantly undermines a patentee’s right to appeal, effectively deterring appeals of erroneous calculations, and undermines the patentee’s rights. Third, the scope of PTE in Korea is unduly narrow and inconsistent with the legislative intent and international practice it was modeled on. The effective patent scope during PTE in Korea is restricted to claims necessary to “working of the patented invention of a product whose approval was the basis for PTE,” and its “specific use.”

- **Inadequate damages for patent infringement:** A Supreme Court decision has undermined patent enforcement in Korea and the ability of innovators to be awarded appropriate damages in the event that a patent-infringing generic launches on the market. When a generic product enters the Korean market, the price of the innovator product is automatically reduced. In November 2020, the Korean Supreme Court held that generic companies were not liable for damages caused by a mandatory price reduction to a patented product even if the patent was upheld and the generic company entered the market illegally, forcing the price cut in question. As a result, damages for infringement of biopharmaceutical patents in Korea are neither adequate to serve as a deterrent to further infringements, nor sufficient to cover the innovators losses, contrary to Korea’s international commitments.

- **Patent enforcement concerns:** While Korea has implemented a patent linkage mechanism pursuant to its KORUS commitment, certain key issues of concern
remain. These issues include the discretion afforded to the Ministry of Food and Drug Safety (MFDS) as to whether to list a patent in the Green List or to permit a change to the patent listing and the limited period of only nine months for a sales stay. In addition, if an innovator elects not to seek a stay of a second (or subsequent) generic/biosimilar, any stay granted against the first generic/biosimilar application is cancelled. Moreover, preliminary injunctions take several months to be granted, thereby frustrating the ability of innovators to prevent irreparable damages in the event potentially infringing products enter the market.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

Market Access

Impermissible Government Pricing and Reimbursement Policies

Since the implementation of a positive reimbursement list system in 2007, new prices of innovative medicines are determined based primarily on cost reduction rather than a holistic assessment of value. Multiple pricing regulations are layered to set artificially low prices for innovative medicines and volume caps, which violates Korea’s international obligations and results in reduced access to innovative medicines for Korean patients and doctors. Eighty-five percent of new medicines launched globally since 2012 are available in the United States compared to just 33 percent in Korea, with Korean patients waiting an average of 28 months from global first launch for the fewer medicines that become available.\(^{340}\) Further, only 22 percent of new medicines are reimbursed by the National Health Insurance in Korea, with patients waiting an average of 46 months from global first launch to public reimbursement.\(^{341}\)

Korea’s Drug Reimbursement Evaluation Committee (DREC) operating under HIRA assesses the cost-effectiveness of innovative medicines using an unreasonably low and outdated threshold on how much can be paid for health gains, with few products exempted. This incremental cost per QALY threshold was set based on Korean GDP per capita in 2007 and has not been increased for most innovative medicines even though Korean GDP per capita is now (as of 2022) more than 80 percent higher.\(^{342}\)

The challenges that this cost-effectiveness threshold present to biopharmaceutical innovators and Korean patients were raised during the 2020 National Assembly Audit, which resulted in a request to HIRA to review the need to adjust the threshold. Unfortunately, HIRA rejected the National Assembly request and further announced in September 2021 that it had removed references to Korean GDP per capita in the relevant regulations and instead would rely on “past assessment results.” Apparently, HIRA would

---

\(^{341}\) Id.

prefer to avoid tying the threshold to current Korean GDP per capita, but it will continue to use very low and outdated thresholds and limit transparency and predictability in the assessment process. In addition, for medicines not subject to the cost-effectiveness threshold, HIRA expanded the number of countries from seven to eight that it can use to recommend the lowest international price. PhRMA is encouraged by progress made by HIRA following industry-wide engagement efforts on predictability, specifically on disclosed incremental cost-effectiveness ratio (ICER) values used from the 2007-2021 cost-effectiveness evaluations. However, HIRA’s continued use of very low and outdated ICER thresholds fails to appropriately recognize the value of innovative medicines.

Manufacturers are often required to make repeated price concessions as they move through the many DREC subcommittees before the final reimbursement recommendation, despite the ostensibly different roles and responsibilities of each subcommittee. For example, the oncology subcommittee tends to review materials that should be reviewed instead by the pharmacoeconomic subcommittee or the budget assessment subcommittee and rejects reimbursement despite proven clinical benefit. There may be other price concessions required that further disincentivize innovation, such as a dose-pricing formula that requires price cuts when a medicine developed for a pediatric indication uses a lower dose than that for adults. Even when a price is recommended following the cost-effectiveness evaluation, the Korean Government tends to impose additional risk sharing agreements in the form of expenditure caps or excessive rebates as a condition of reimbursement.

Following DREC review and recommendation of a maximum reimbursement price, the National Health Insurance Service (NHIS) conducts a price negotiation with the manufacturer. During negotiations, the price for a new innovative medicine recommended by the cost-effectiveness evaluation tends to be lowered based on the prices of off-patent and generic comparators, as well as the prices in other countries. New medicines that HIRA evaluates based on WAP do not undergo NHIS price negotiations and instead are generally listed at 90 percent of WAP regardless of budget impact; however, given the prevalence of off-patent and generic medicines in the WAP calculation, the prices of innovative medicines in Korea continue to be significantly depressed. The MoHW has the ultimate authority for approving all pricing and reimbursement decisions.

Over the last decade, the Korean Government has used excessive and repetitive measures to further reduce prices of innovative medicines, such as Actual Transaction Pricing (ATP) investigations and price cuts associated with volume and new indication expansions. If the reimbursement scope is expanded or claim amounts increased, then prices can be significantly reduced through various mechanisms during the period of patent protection. For example, NHIS implements mandatory volume-based price cuts whenever an innovative medicine exceeds by 30 percent the sales volume originally negotiated for the introductory year. As a result, there is a very high likelihood of subsequent price cuts. Greater flexibility is needed to establish reasonable volume targets beyond the introductory year. In addition, the MoHW is planning to increase the current 10 percent cap on volume-based price cuts in the price-volume agreement system.
NHIS can also require risk-sharing agreements (RSAs) as a condition of reimbursement that are designed to force additional concessions from manufacturers of innovative medicines. RSAs are renewed every five years based on a cost-effectiveness re-evaluation that creates additional administrative burdens and price erosion of reimbursed products. While industry supports some forms of voluntary RSAs, these payment mechanisms will only be helpful if they facilitate greater flexibility on pricing and patient access and are coupled with broader reforms that allow for appropriate recognition of the value of patented medicines.

Combined, Korea’s pricing policies negatively impact the rights of U.S. innovators and constitute a failure to “appropriately recognize the value of the patented pharmaceutical product,” in violation of KORUS Article 5.2(b).

Moreover, Korea’s pricing and reimbursement regime goes far beyond a “limited exception” to the patentee’s exclusive rights and thus is inconsistent with KORUS Article 18.8(3) and Korea’s broader obligations under the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). TRIPS Article 28 provides that a patent “shall confer” on its owner the exclusive rights to prevent third parties without the owner’s consent from “the acts of: making, using, offering for sale, selling, or importing for these purposes that product.”\(^{343}\) In turn, TRIPS Article 30 permits WTO members to grant only “limited” exceptions to these exclusive rights, provided that such exceptions do not conflict with the “normal exploitation” of the patent and do not prejudice the legitimate interests of the patent owner.\(^{344}\) The \textit{Canada – Pharmaceutical Patents} panel appropriately recognized that the “normal exploitation” of a patent includes the realization of anticipated “economic returns” during a defined period of exclusivity “as an inducement to innovation.”\(^{345}\) This TRIPS jurisprudence supports a parallel reading of KORUS Article 18.8(3).

\(^{343}\) TRIPS Article 28.

\(^{344}\) \textit{Id.} Article 30.

\(^{345}\) WTO, Panel Report, \textit{Canada – Patent Protection of Pharmaceutical Products}, WT/DS/114/R, ¶¶ 7.54-55 (adopted Mar. 17, 2000), available at https://www.wto.org/english/tratop_e/dispu_e/7428d.pdf (last visited Oct. 21, 2023). Similarly, the TRIPS Agreement negotiating history indicates that the “rights conferred” by a patent within the meaning of TRIPS Article 28 include the right to sell pharmaceutical products at prices that would permit recoupment of investments and provide an incentive to develop innovative products. In a 1987 statement, the United States set forth this view, stating that “price control” was not a legitimate reason to deny intellectual property protection or to “impose conditions that preclude reasonable compensation for use of an invention or creation.” Statement by the United States at Meeting of 25 March 1987, MTN.GNG/NG11/W/2 (Apr. 3, 1987), at 3. As the United States expressed at that time, “[s]uch policies interfere with obtaining and maintaining intellectual property rights and thus reinforce the direct distortion of trade that results from such policies.” \textit{Id.} Others involved in the TRIPS negotiations made similar statements. At a September 1989 meeting, a participant discussed providing patentees “the right to exclude others from making, using or selling the patent or invention for a specified time” and asserted that “[t]hese rights were necessary to provide patentees with the necessary economic incentive to justify investment in innovation.” Negotiating Group on Trade-Related Aspects of Intellectual Property Rights, Meeting of the Negotiating Group of 12-14 July 1989: Note by the Secretariat, MTN.GNG/NG11/14 (Sept. 12, 1989), ¶ 75. In a previous meeting, another TRIPS negotiator noted that “the recovery of an investment of a patented product depended not only on the duration of patent[] rights[s] but also on a number of other factors, for example whether there was price control.” Negotiating
Under terms of a premium pricing policy for global innovative drugs approved in June 2017, Korea impermissibly provided reimbursement price preferences and other advantages to products developed by local companies. These policies discriminated against U.S. and other foreign-based innovative biopharmaceutical companies and were the subject of renegotiated KORUS commitments agreed to in 2018. Following this agreement, HIRA revised the premium pricing policy for global innovative drugs effective from January 2019. However, the new criteria are so strict and unworkable that it is highly unlikely that any innovative medicine would be eligible for premium prices. While it was hoped that Korea would use this opportunity to demonstrate its broader pledge to apply fair and reasonable rules and appropriately value innovative medicines, Korea has implemented this commitment in a manner that eviscerates the ability of companies to qualify for premium pricing and is contrary to the spirit of the commitment it made to the U.S. Government.

Lack of Transparency, Predictability and Due Process

Since 2010, MoHW has repeatedly changed its pharmaceutical pricing and reimbursement policies without considering the long-term implications for innovation and market predictability, resulting in an uncertain business environment for innovative pharmaceutical companies in a manner that is inconsistent with Korea’s transparency and due process obligations under KORUS Article 5.3. This was exemplified by HIRA’s recent proposal to expand the reference basket of countries. That proposal, which was issued on November 21, 2022, provided a mere 20 days for comments (far shorter than the 60-day period provided for in Article 5.3.3(b) of KORUS).346

Korea also does not provide meaningful transparency and due process for companies that apply for reimbursement. The various subcommittees involved in the reimbursement process do not share the outputs of their deliberations and applicants are often not provided with a satisfactorily informative written basis for evaluations and decisions, as well as reasonable opportunities for appeal. In addition, following the HIRA review, there is a separate and onerous review by the NHIS on price and volume determinations, resulting in additional price concessions below the prices already set by HIRA.

Finally, under Article 5.3(5)(e) of KORUS and the side letter thereto, Korea agreed to “make available an independent review process that may be invoked at the request of an applicant directly affected by a [pricing/reimbursement] recommendation or determination.” Korea has taken the position, however, that reimbursed prices negotiated with pharmaceutical companies should not be subject to the independent review mechanism because the NHIS does not make “determinations” and merely negotiates the final price at which a company will be reimbursed. Moreover, for many innovative

---

346 Further, the proposal provided little to no explanation for the proposed change, contrary to Articles 5.3.3(a) and 21.1.3(c) of KORUS, and did not provide a reasonable period between the finalization of the regulation and its implementation on January 1, 2023, contrary to Article 5.3.4 of KORUS.
medicines, prices are decided by HIRA based on WAP without subsequent price negotiations with NHIS. However, this interpretation negates the original purpose of the independent review mechanism, which should apply to the process for setting prices of all reimbursed medicines, particularly patented medicines. While an independent review process is actively used for medical devices, there is not an effective independent review mechanism relating to medicine reimbursement, in part because regulations permit HIRA to conduct re-evaluations even after an independent review has taken place.

**Discriminatory Innovative Pharmaceutical Company Accreditation**

The MoHW designates certain companies as IPCs, which receive tax credits, R&D support and more favorable drug pricing. However, the current accreditation criteria discriminate against U.S. and other foreign innovators by requiring domestic investments to prove “innovativeness.” As of September 2023, only 3 of 47 designated IPCs are non-Korean biopharmaceutical companies. PhRMA is concerned that this policy violates national treatment obligations and the spirit of KORUS Article 5.1. Moreover, the accreditation process lacks transparency and predictability. For example, companies are denied inclusion on the accreditation list without any explanations. To fulfill the IPC objectives to foster biopharmaceutical innovation, the criteria and process should be revised so that it is transparent, provides due process and is equally available to domestic and foreign innovators in how it defines investment.

**Intellectual Property Protection**

**Patent Term Extension**

While Korea has implemented PTE, there are three significant issues. First, the PTE calculation should include all relevant essential clinical trials used for the approval of the Korean product, including essential clinical international trial that are submitted as a part of the Korean dossier for approval of the product. Failure to do so has a discriminatory effect on companies outside Korea that conduct necessary trials, on which the Korean MoHW relies in approving the drug, outside of Korea. The Korean Patent Court has held that foreign clinical trials should not be excluded from the calculation of the extended term. The Patent Office should reflect this holding and immediately change its current unfair practice.

Second, there is a lack of due process in the PTE procedures. If the Patent Office determines a certain duration of PTE that is less than the full amount originally requested by the patentee and the patentee challenges that determination and subsequently loses the challenge, no PTE is granted; even the duration previously determined by the Patent Office is lost. This all-or-nothing approach significantly undermines a patentee’s right to appeal, effectively deterring appeals of erroneous calculations, and undermines the patentee’s rights.

Finally, the scope of PTE protections under Article 95 of the Korean Patent Act is excessively narrow, in that it restricts the effective patent scope during PTE to the
“working of the patented invention of a product whose approval was the basis for PTE,” and the “specific use.” This approach diverges from that adopted by most other developed economies that provide for PTE. In the United States and Europe, for example, PTE protections extend more broadly to products with the same therapeutic effect and medicinal use (including salt or ester forms), while PTE in Japan similarly covers not only the particular medicinal product approved, but also other medicinal products substantially identical to it.

In June 2022, the Korean Intellectual Property Office (KIPO) announced plans to reform the PTE system. In April 2023, KIPO’s PTE reform proposal was introduced for adoption by the National Assembly. The PTE reform proposal does not address the significant concerns discussed above but cherry picks aspects of other international systems to tip the balance further against innovators.

Inadequate Damages for Patent Infringement

A decision by the Korean Supreme Court has undermined patent enforcement in Korea and the ability of innovators to be awarded appropriate damages if a patent-infringing generic launches on the market. When a generic product enters the Korean market, the price of the innovator product is automatically reduced. In November 2020, the Korean Supreme Court held that generic companies were not liable for damages caused by a mandatory price reduction to a patented product even if the patent was upheld and the generic entered the market illegally, forcing the price cut in question. This jurisprudence is inconsistent with Korea’s international commitments. Specifically, Article 41(1) of the TRIPS Agreement requires WTO members to provide “remedies which constitute a deterrent to further infringements”. The Supreme Court decision essentially eliminates any deterrent for a generic company to launch their product during ongoing patent litigation. Further, it contravenes Korea’s commitment in Article 18.10(5)(b) of KORUS that “in determining damages for infringement of intellectual property rights, its judicial authorities shall consider … the value of the infringed good or service measured by the market price ….” That market value cannot reasonably be the reduced price triggered by the launch of a patent infringing generic.

Strong patent protection is necessary for innovative companies to continue to invest in R&D for innovative medicines. The Korean Supreme Court ruling undermines that foundation and will inevitably have an adverse impact on future R&D and public health in Korea. A patent right should be protected during the entire patent term. Where a final decision to invalidate a patent is not yet rendered, a generic company willing to take the risk of infringing the patent should bear full responsibility for its choice. However, the Supreme Court’s decision and current legal system in Korea make it difficult to substantively protect patents for innovative medicines, considerably undermine the value of drug patents and will discourage future investments and innovations.
Patent Enforcement

Consistent with its IP obligations under KORUS,\textsuperscript{347} effective March 15, 2015, Korea implemented the framework of an effective patent enforcement system. PhRMA continues to monitor a number of key issues concerning this system. First, the system provides overly broad discretion to MFDS to determine whether to list a patent in the Green List or to permit a change to the patent listing. Second, the system only provides for a nine-month sales stay. In the ordinary course, this is not an adequate period of time to resolve a patent dispute (consistent with Article 18.9(5)(b) of KORUS) before an infringing product is allowed to enter a market. Third, the sales stay system mechanism is problematic in that it requires the patentee to seek a sales stay against all generic/biosimilar applications, regardless of whether those products may infringe the innovator’s patent(s), as long as they are the same in terms of (i) active ingredient and amount thereof, (ii) formulation, (iii) dosage and administration, and (iv) efficacy and effectiveness. If the patentee fails to do so, the sales stay against the first generic/biosimilar is canceled. Moreover, while preliminary injunctions are available in Korea, in practice it takes several months for them to be granted, thereby frustrating the ability of the innovator to seek an injunction before potentially infringing products are allowed to enter the market.

\textsuperscript{347} See U.S.-Korea Free Trade Agreement, Art. 18.9, para. 5.
MALAYSIA

PhRMA and its member companies operating in Malaysia remain concerned by the Government of Malaysia’s continued actions that undermine intellectual property (IP) protection and encourage other countries in the region to take similarly damaging actions.

Key Issues of Concern:

- **Compulsory licensing:** Through a flawed and non-transparent process, the Malaysian Government issued a compulsory license (CL) for a breakthrough innovative medicine developed in America that provides a cure for patients suffering from hepatitis C. This action was taken despite the fact that the U.S. manufacturer had agreed to include Malaysia in its voluntary license program. In late 2021, the Ministry of Health (MoH) suggested that remaining courses of treatment manufactured under this CL could be used in a medical tourism program. While this CL has not been renewed, Malaysia’s recently-enacted 2022 Patents (Amendment) Act, continues to promote ambiguous and inappropriately broad grounds for compulsory licensing. These actions undermine innovator confidence in Malaysia and set a negative precedent for other markets, adoption of which would significantly undermine the R&D model for innovative medicines on which the U.S. biopharmaceutical industry and patients around the world rely.

- **Inadequate IP protection and enforcement:** Malaysia does not have an effective patent enforcement system that allows for early resolution of patent disputes before marketing approval is granted to potentially infringing products during the patent term. In addition, Malaysia’s regulatory data protection (RDP) system fails to provide (1) adequate protection for biologics; and (2) effective protection for a sufficient period of time for chemically synthesized drugs from the date of marketing approval in Malaysia.

- **Medicine Price Control policy:** The industry shares the Malaysian Government’s goal to improve patient access to innovative medicines. However, the proposed introduction of the Medicine Price Control (MPC) to set wholesale and retail ceiling prices for medicines will not resolve long-term health care cost challenges and could further delay patient access to new medicines. The Malaysian Government took the positive step of conducting a comprehensive cost-benefit analysis of the proposal, in collaboration with industry associations, and those findings were published on the Malaysian Productivity Council Unified Public Consultation platform in late November 2021 for public comment. The findings indicated that a loss of jobs and worsened health outcomes would likely result if the MPC was implemented.\(^{348}\) While the proposal has not moved forward since those results

were shared, a formal decision has not been made.\textsuperscript{349} Moreover, the MPC proposal remains in the National Medicine Policy (DUNAS) as a key strategy and alternative proposals to control prices are being discussed.\textsuperscript{350}

- **Listing medicines on the national formulary:** As of 2016, Malaysia adopted a new process for listing medicines on the MoH Medicines Formulary. While this was a welcome development, PhRMA and its members are concerned that the final guidelines require six to 12 months of post-marketing surveillance data prior to listing and that there is no mechanism to ensure that patients who benefited from the medicines during local clinical trials can maintain access during this period. In addition, if a product is not approved for listing on the formulary, the applicant should be provided a detailed explanation for that decision so that it can better understand the criteria for listing and to determine if it may negotiate an alternative access scheme with the government. MoH listing decisions continue to lack transparency and are based on ambiguous criteria.

- **Preferential treatment of local manufacturers:** The Malaysian Government indirectly discourages a fair, open and competitive marketplace for international pharmaceutical compounds through procurement preferences for locally manufactured products. For example, the Malaysian Government has announced that it will grant three-year procurement contracts to companies that move production of imported products to Malaysia, with the potential for a two-year extension if those locally produced products are exported.

- **Halal pharmaceuticals:** In December 2017, the MoH published a guideline on prescribing and administration of non-halal pharmaceuticals. PhRMA’s member companies, while strongly supportive of religious and cultural sensitivities, do not believe that the government should provide preferential treatment to such products in government procurement, but instead adhere firmly to the tenets of safety, quality and efficacy of medicines. Furthermore, it is important to ensure that patients, in partnership with their health care providers, are prescribed the appropriate medicine for their conditions.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

Intellectual Property Protection

Compulsory Licensing

In September 2017, the Malaysian Government utilized a non-transparent process to issue a CL on a patent-protected innovative U.S. medicine to treat hepatitis C. This unnecessary and unjustified measure was taken in a unilateral and non-transparent fashion, despite the fact that the U.S. manufacturer had decided to include Malaysia in its voluntary licensing program. The CL has sent a signal to America’s biopharmaceutical innovators that their patents are not safe in Malaysia. Moreover, the Malaysian government appears to be inappropriately leveraging the CL to encourage medical tourism and travel to Malaysia.351

While imposing a license is rarely, if ever, an appropriate mechanism to improve patient access, that is particularly true in this instance. Industry experience clearly demonstrates that collaborative access policies enable significantly better treatment access outcomes. Malaysia’s CL reportedly only treated 1,501 patients with hepatitis C over a 12-month period in 2018.352 In contrast, cooperative discussions and collaborative access policies like voluntary licensing treated over 15,000 patients over the same period in neighboring Vietnam.353

While this CL has significantly undermined investor confidence in Malaysia, industry is glad to see that the Malaysian Government elected not to renew the CL when it expired in October 2020. This promising action may be undermined, however, by reports that Malaysia is considering CLs for other products.354

Further, in August 2019, Malaysia’s intellectual property office (the Intellectual Property Corporation of Malaysia or MyIPO), released for public comment a “consultation paper” on proposed amendments to the Patents Act 1983.355 The consultation paper and commenting period were not widely publicized. The resulting Patents (Amendment) Act 2022 promotes vague and ambiguous grounds for compulsory licensing including selling

---

products at “unreasonably high prices.” While PhRMA provided MyIPO an initial response calling for the Malaysian Government to engage in a meaningful and transparent consultation process, there was limited stakeholder engagement and debate on this consequential piece of legislation.

Regulatory Data Protection (RDP)

To support the significant investment of time and resources needed to develop test data showing a potential new medicine is safe and effective, governments around the world protect that data submitted for regulatory approval from unfair commercial use for a period of time. TRIPS Article 39.3 requires WTO members, including Malaysia, to protect proprietary test data submitted to market authorizing bodies, including the MoH, “against unfair commercial use” and against “disclosure.”

The stated objective of Malaysia’s Directive (11) dlm. BPFK/PPP/01/03 Jilid 1 is “to protect the undisclosed, unpublished and non-public domain pharmaceutical test data … for the purpose of scientific assessment in consideration of the quality, safety, and efficacy of any new drug product ....”\footnote{See paragraph 1.2 of Directive BPFK/PPP/01/03.}

Further, paragraph 4.2 of that Directive provides:

An application for Data Exclusivity shall only be considered if the application in Malaysia for:

(i) New drug product containing a New Chemical Entity is made within eighteen (18) months from the date the product is first registered or granted marketing authorization; AND granted Data Exclusivity / Test Data Protection in the country of origin or in any country, recognized and deemed appropriate by the Director of Pharmaceutical Services ....\footnote{Id.}

As such, Malaysia requires the marketing authorization application of the new medicine to be filed within 18 months from the first worldwide regulatory approval in order to be considered as a “new chemical entity” and, thus, eligible for RDP in Malaysia. If the 18-month deadline is not met, the product loses data protection, allowing a follow-on
molecule to be approved based on the originator’s regulatory data during what should have been the RDP period. It is challenging – if not impossible – to meet the 18-month application requirement if the first worldwide registration was not in the EU or the United States (both are relied upon for the Certificate of Pharmaceutical Product application).

In addition to this inappropriate restriction on products eligible for RDP in Malaysia, the actual term of the protection in Malaysia is measured from the date of first approval in the world. Thus, if a new chemical entity is registered in Malaysia one year after first approval in the world, Malaysia only provides four years of RDP. Indeed, the only instance in which an innovator can receive the full five years of RDP in Malaysia is if they seek marketing approval in Malaysia first.

Malaysia’s flawed Directive improperly penalizes innovators for first seeking marketing approval in other countries. As in other markets that seek to promote research and development into innovative medicines, Malaysia should measure the term of the RDP protection from the time that the new molecule is approved in Malaysia.

Finally, Malaysia fails to provide any RDP for biologics. Made from living organisms, biologics are complex and challenging to manufacture and may not be protected adequately by patents alone. Without the certainty of a substantial period of exclusivity, innovators may not have the incentives needed to conduct the expensive, risky and time-consuming work to discover and bring new biologics to market.

**Effective Patent Enforcement**

PhRMA members encourage Malaysia to enforce its Patent Act efficiently and effectively. A competent and practical enforcement mechanism provides redress and solutions to infringements of IP rights and deters future infringement. Timely and efficient patent enforcement gives owners an appropriate period over which to recoup the value of their significant efforts and investment. For example, patent protection and enforcement would be enhanced by structured enforcement guidelines and a mechanism to curb unfair promotion and sale of generic drugs either prior to patent expiry of innovator drugs, or, in the event of a patent dispute, prior to a court decision on patent disputes.

On October 5, 2022, Malaysia ratified the Comprehensive and Progressive Trans-Pacific Partnership (CPTPP). While CPTPP requires Malaysia to adopt a patent notification system and make available early dispute resolution mechanisms, current proposals to implement these obligations would put the onus on patent holders to monitor the submission of follow-on marketing applications rather than provide direct notice to the innovator that a follow-on application has been filed that may infringe the innovator’s patents. Disappointingly, the amended Patent Act 2022 included no provisions on effective enforcement of patents even though the revisions were largely intended to codify Malaysia’s international commitments under several international agreements, including CPTPP. PhRMA strongly encourages the Malaysian Government to work with industry to ensure that implementation of these CPTPP commitments results in mechanisms that strengthen patent enforcement and the ability to resolve outstanding patent concerns.
prior to marketing approval and launch of follow-on products. These mechanisms could greatly enhance Malaysia’s business environment by: (1) providing transparency and predictability to the process for both innovative and generic pharmaceutical companies; (2) creating a more predictable environment for investment decisions; and (3) ensuring timely redress of genuine disputes.

**Market Access**

**Medicine Price Control (MPC) Policy**

Only 22 percent of new medicines launched globally since 2012 are available in Malaysia, with patients waiting on average 34 months after global first launch for the fewer medicines that become available.\(^{359}\) The industry shares a common goal with the Malaysian Government to improve patient access to innovative medicines. However, the MPC proposal to set wholesale and retail ceiling prices for medicines will not address long-term health care cost challenges and could further delay patient access to new medicines. A comprehensive cost-benefit analysis that included meaningful engagement with industry and other stakeholders was initiated in August 2021 to understand the full impact of the proposed MPC on the Malaysian health care system. Findings of the cost-benefit analysis were shared on the Malaysian Productivity Council Unified Public Consultation platform in late November 2021 for public comment. Findings indicate that a loss of jobs and worsened health outcomes would result if the MPC was implemented. PhRMA and its member companies recommend that the Malaysian Government re-evaluate alternatives to the MPC to reduce its negative impact. While the proposal has not moved forward since these results were shared, it has not been formally rescinded.\(^ {360}\) Moreover, the Medicine Price Control proposal remains in the National Medicine Policy (DUNAS) as a key strategy and alternative policies to control prices are being discussed.\(^ {361}\)

**Listing Pharmaceuticals on the National Formulary**

The industry welcomed Malaysian Government guidelines introduced in January 2016 that allowed companies to request inclusion on the national formulary. However, the listing process lacks transparency and appears to be based on unclear criteria. In addition, the guidelines require six or 12 months of post-marketing surveillance data prior to listing. As a result, patients in local clinical trials cannot automatically continue receiving the product. A policy is needed to bridge the gap for patients from the end of a clinical trial to listing on the national formulary. In addition, if a product is not approved for listing on the formulary, the applicant should be provided a detailed explanation for that decision.

\(^{361}\) Id.
so that it can better understand the criteria for listing and to determine if it may negotiate an alternative access scheme with the government. MoH listing decisions, both by the body responsible for conducting HTA and making listing recommendations and the panel responsible for the ultimate listing decision, currently lack transparency and are based on unclear criteria.

Further, as the Malaysian Government pursues reforms aimed at improving patient access to medicines, PhRMA member companies hope that sufficient financing is provided to ensure that more patients can receive innovative medicines in a timely manner. Short-term measures, such as cost-containment policies, should not become a barrier to patient access and the government should consider fair mechanisms to value innovations that are proven to raise health care standards in Malaysia.

** Preferential Treatment of Local Manufacturers

Malaysia’s National Medicines Policy, which prioritizes the medium- and long-term goals set by the government for the biopharmaceutical sector, endorses price controls, automatic generic drug substitution and preferences for generics and local manufacturers for medicines on the National Essential Medicines List. These discriminatory preferences for locally manufactured products discourage an open and competitive marketplace.

** Halal Pharmaceuticals

In December 2017, the MoH published guidelines on prescribing and administration of non-halal medicines. PhRMA member companies support religious and cultural sensitivities but believe that it is important to ensure that patients, in partnership with their health care providers, are prescribed the appropriate medicine for their conditions. PhRMA member companies urge the government to ensure that the stipulations and requirements for Halal certification take into consideration and align with the biopharmaceutical industry’s rigorous standards and practices already in place that ensure safety, efficacy and good manufacturing processes.

---

PhRMA and its member companies operating in Mexico are increasingly concerned with changes to Mexico’s pharmaceutical policies, particularly with respect to market access delays due to challenges in the regulatory approval process, accessing public formularies and new public procurement processes, weak patent enforcement and other significant intellectual property (IP) issues, and, more broadly, with growing legal uncertainty and a lack of transparency around government decision-making processes. With the United States-Mexico-Canada Agreement (USMCA) now in effect, it is critical that Mexico implement and maintain systems that are consistent with its trade commitments.

**Key Issues of Concern:**

- **Market access delays:** The Federal Commission for Protection against Health Risks (COFEPRIS) has severely delayed the marketing authorization process for pharmaceutical products since early 2019. In addition, significant existing market access barriers remain due to lengthy, non-transparent and unpredictable procurement processes. A lack of transparency around the implementation of a National Medicines Compendium and disease-specific treatment guidelines, as well as challenges and uncertainty in accessing the formularies of public health institutions, create additional delays that restrict patient access to innovative medicines. During the past five years, the share of new medicines launched globally over the prior ten years that are available in Mexico declined from 38 to 25 percent – a worse decline than in any other OECD or Latin American country.\(^{363}\)

- **Challenges with public procurement practices:** Since 2018, Mexico has made frequent and nontransparent changes to its public procurement system. In 2019, Mexico created uncertainty in the bilateral trade of public purchases by consolidating and transferring authority for the public procurement of medicines from individual public health institutions to the Ministry of Finance and later, in 2022, to the Ministry of Civil Service. From 2021 to 2022, Mexico decided to outsource a significant proportion of its public purchases of medicines to the United Nations Procurement Office (UNOPS). The UNOPS process lacked transparency, predictability, and effectiveness. Further, in November 2022, the General Council for Health (CSG) amended the regulations governing the Compendium to require applicants to obtain and submit a letter of necessity from at least one CSG institution member to participate in government tenders. These many significant changes and unreasonable implementation timelines created significant market access barriers for PhRMA member companies, resulting in supply chain challenges and product shortages for Mexican patients and concerns about product traceability and patient safety. Only 12 percent of new medicines launched globally since 2012 are publicly reimbursed in Mexico, with patients waiting an

---

average of 55 months from global first launch for available medicines to become publicly reimbursed.  

- **Weak patent enforcement and regulatory data protection failures:** Mexico, in response to its USMCA commitments, promulgated the Federal Law for Protection of Industrial Property which entered into force on November 5, 2020. While this is a welcome step, implementing regulations have not yet been issued. Also, while PhRMA’s member companies appreciate COFEPRIS’s recent proposal attempting to address challenges in Mexico’s patent enforcement regime, shortcomings in the proposal will continue to compromise the ability of right holders to resolve outstanding patent concerns prior to marketing approval and launch of follow-on products. Further, obtaining effective preliminary injunctions or final decisions on cases regarding IP infringement within a reasonable time (as well as collecting adequate damages when appropriate) remains the exception rather than the norm. Additionally, despite its commitments under USMCA, Mexico still lacks measures to restore a portion of the patent term lost during the regulatory approval process and consolidation of substantive regulatory data protection (RDP) in a federal law is still pending. Furthermore, the new Mexican Federal Law for Protection of Industrial Property does not provide appropriate RDP for biologics, only for chemical compounds and combinations thereof, contrary to Mexico’s USMCA commitments.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Weak Patent Enforcement**

Several deficiencies have confounded the effective enforcement of patents in Mexico. Recognizing that these deficiencies hinder its new commitments to protect and enforce patents in the USMCA, Mexico enacted the Federal Law for Protection of Industrial Property, which entered into force on November 5, 2020, in order to address them. However, implementing regulations have not been released and at this point PhRMA and its member companies are unable to assess whether the new law will address the deficiencies in Mexico’s patent enforcement system as outlined below.

Mexico has taken some positive steps to improve patent enforcement, including adopting the Linkage Decree of 2003, although the decree has not been implemented in a comprehensive and consistent manner. The publication in the Gazette of Patents Protecting Medicines (Gazette) is a positive step toward the goal of eliminating unnecessary, costly and time-consuming court actions to obtain appropriate legal protection for biopharmaceutical patents. However, use patents still require lengthy and costly litigation to achieve inclusion in the Gazette. Furthermore, COFEPRIS appears to
apply linkage inconsistently and possibly in a discriminatory manner. In some cases, marketing authorizations have been issued despite patents being listed in the Gazette. As a result, there have been concerning instances (at least three in April 2017) where COFEPRIS granted marketing authorization for entry of products for which a valid patent exists. Additionally, the lack of implementing regulations for the Federal Law for Protection of Industrial Property has left PhRMA members without key details regarding the scope of the patent enforcement regime, including which patents would be subject to the system. This undermines company confidence in the IP system in Mexico and impedes companies’ ability to do business in Mexico.

Despite the efforts of COFEPRIS to timely publish health registration requests, PhRMA member companies are unable to obtain accurate and timely information from COFEPRIS prior to marketing authorization being granted on a generic or biosimilar drug where the innovator product is used as a reference. As a result, innovators have little to no notice that a potentially patent infringing product is entering the market. While COFEPRIS recently proposed a mechanism to improve the notification system, the proposal still falls short of effective patent enforcement as outlined in the USMCA. For example, the proposed process does not ensure that right holders receive direct notification of pending follow-on applications. Also, securing effective preliminary injunctions or final decisions on cases regarding IP infringement within a reasonable time (as well as collecting adequate damages when appropriate) remains the exception rather than the norm. Although injunctions may be initially granted subject to the payment of a bond, counter-bonds, or in some proceedings only on applications, motions may be submitted by the alleged infringer to lift the injunction and allow the challenged product to enter the market.

Even if an innovator successfully enforces its IP rights in Mexico, seeking monetary damages is extremely burdensome. In order to claim damages from patent infringers in Mexico, litigants are required to first obtain a final administrative action and then seek damages through a civil action, actions that can take longer than ten years.

Mexico has repeatedly committed to providing effective patent enforcement mechanisms in NAFTA, the WTO Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) and most recently in the USMCA. It is critical that Mexico act on its commitments by implementing an effective patent enforcement system. In order for Mexico to succeed in this effort, it will be essential that Mexico reject calls from some in Congress that would inappropriately limit the scope of Mexico’s patent linkage system. PhRMA and its member companies encourage the Mexican Government to hasten patent infringement proceedings, use all available legal mechanisms to enforce Mexican Supreme Court decisions and implement procedures necessary to provide timely and effective preliminary injunctions.

Additionally, on November 18, 2020, COFEPRIS issued an executive order under which it will expedite the market authorization process for medicines that have been approved by certain foreign regulatory agencies, including the U.S. Food and Drug Administration, European Medicines Agency, or the World Health Organization.
Prequalification Program for Medicines and Vaccines. Applications for these medicines will be automatically approved within ten days unless COFEPRIS issues a request for further information from the applicant. However, that executive order has not been systematically applied and authorizations issued pursuant to this order are limited to supplying the public healthcare system. Further, it remains unclear how COFEPRIS will ensure that medicines approved under this new mechanism do not infringe on an innovator's IP rights, mindful of Mexico’s international commitments.

**Lack of Patent Term Restoration (PTR)**

Mexico remains one of the few members of the OECD that does not provide PTR for effective patent term lost during the lengthy development and regulatory approval process. This situation is exacerbated by the current delays of COFEPRIS in approving medicines, resulting in significant patent term lost due to no fault of the inventor or patent owner. PhRMA appreciates that Mexico has agreed to implement such term restoration in the USMCA subject to a 4.5-year transition. Nonetheless, the lack of such protection in the meantime undermines the term of patent protection in Mexico and consequently undermines the ability of our members to sustainably bring new therapies to Mexican patients. PhRMA urges USTR and other federal agencies to encourage Mexico to implement appropriate PTR provisions as soon as possible.

**Regulatory Data Protection Failures**

Biopharmaceutical innovators work with hospitals, universities and other partners to rigorously test potential new medicines and demonstrate they are safe and effective for patients who need them. Less than 12 percent of medicines that enter clinical trials ever result in approved treatments.

To support the significant investment of time and resources needed to develop test data to prove that a new medicine is safe and effective, the international community has developed a mechanism recognized as essential to biopharmaceutical innovation whereby the data submitted is protected from unfair commercial use for a period of time. The mechanism is enshrined in TRIPS Article 39.3, which requires WTO members to protect undisclosed test and other data submitted for marketing approval in that country against disclosure and unfair commercial use.

RDP is essential for all medicines and particularly critical for biologic therapies. Produced using living organisms, biologics are complex and challenging to manufacture and may not be protected adequately by patents alone. Unlike generic versions of

---

traditional chemical compounds, biosimilars are not identical to the original innovative medicine and there is greater uncertainty about whether an innovator’s patent right will cover a biosimilar version. Without the certainty of some substantial period of market exclusivity, innovators will not have the incentives needed to conduct the expensive, risky and time-consuming work to discover and bring new biologics to market. Unfortunately, the new Mexican Federal Law for Protection of Industrial Property does not appear to provide appropriate RDP for biologics or chemical compounds, contrary to Mexico’s commitments under Articles 20.48 and 20.49 of the USMCA.

In June 2012, COFEPRIS issued guidelines to implement RDP for a period not less than five years – an important step toward fulfilling Mexico’s international obligations. PhRMA members initially welcomed this decision as an important confirmation of Mexico’s obligations and its intention to fully implement the NAFTA and TRIPS provisions.

As guidelines, however, their validity may be questioned when applied to a concrete case. Further, they could be hard to enforce and may be revoked at any time. Therefore, PhRMA members strongly urge the passage of binding federal regulations on RDP to provide certainty regarding the extent and durability of Mexico’s commitment to strong IP protection, consistent with Mexico’s international commitments under the USMCA.

**Potential Abuse of the “Bolar” Exemption**

Mexico allows generic manufacturers to import active pharmaceutical ingredients and other raw materials contained in a patented pharmaceutical for purposes of preparing marketing authorizations during the last three years of the medicine’s patent term (or the last eight years for a biologic), per the *Bolar* exemption. However, since the implementing regulations of the new IP Law are still pending, Mexico fails to impose any limits on the volume of raw materials that can be imported under this exception.

Given some of the import volumes reported, PhRMA’s members are very concerned that some importers may be abusing the *Bolar* exemption by stockpiling and/or selling patent-infringing and potentially substandard medicines in Mexico or elsewhere. PhRMA members encourage Mexican authorities to establish clear criteria for the issuance of import permits that respect patent rights and appropriately limit imports to quantities required for testing bioequivalence.

**Market Access**

**Market Access Delays**

In addition to delays during the regulatory review process, the local innovative pharmaceutical industry association, Asociación Mexicana de Industrias de Investigación Farmacéutica (AMIIF), has estimated that it takes five years on average for Mexican patients to access innovative medicines following regulatory approval and that this delay is increasing. COFEPRIS previously made improvements to the marketing authorization
process despite limited resources; however, since early 2019, progress has backtracked. While the New Molecules Committee has made progress in the last year, delays remain a problem with many marketing authorizations for new molecules and new indications still pending review.

Once COFEPRIS grants a marketing authorization, there remain significant barriers for patients, primarily those covered by public institutions, in accessing important medicines. This additional delay is caused by the lengthy, non-transparent and uncertain public procurement system used in Mexico, which adds, on average, two years to patient access timelines in the public sector (if a medicine is made available at all). In addition, inclusion into the basic formulary of a public health institution does not automatically result in the purchase and subsequent availability of those medicines to patients.

More specifically, after COFEPRIS grants marketing authorization, the National Health Council (NHC) decides which medicines should be included in the National Compendium, a process that further delays patient access to those medicines. Only 25 percent of new medicines launched globally since 2012 have launched in Mexico, with patients waiting an average of 25 months from global first launch for the medicines that become available. During the past five years, the share of new medicines launched globally over the prior ten years that are available in Mexico declined from 38 to 25 percent – a worse decline than in any other OECD or Latin American country.

Challenges with Public Procurement Practices

In 2019, the Mexican Government further consolidated and transferred authority for the public procurement of medicines from the individual public health institutions (e.g., IMSS, ISSSTE, INSABI, etc.) to the Ministry of Finance. In 2023, another amendment was introduced to permit the Ministry of Public Service and the Ministry of Health to conduct public procurement of medicines in particular cases. The National Health Council supports this centralized process by developing disease-specific treatment guidelines aimed at reducing the number of medicines on the National Medicines Compendium but without clear criteria and transparency. Several tenders and public purchases without tenders were conducted under this process based on new rules that lacked transparency in process and requirements, and that are inconsistent with Mexican public procurement, as well as Mexico’s obligations under NAFTA (in force at that time) and USMCA (see below). For example, Mexico bypassed its normal procurement process and conducted open international tenders. While the Mexican Government asserted that the price preference granted under such tenders for Mexican products would be extended to products originating from FTA trading partners, the rush and lack of transparency regarding how the awards were granted raised questions as to whether those assurances were honored.

---

368 Id.
Adding to these challenges, in 2020 Mexico published executive orders to permit the procurement of medicines not approved by the Federal Commission for Protection against Sanitary Risk (COFEPRIS) and amended the Federal Procurement Law to outsource its purchases of medicines to UNOPS. However, the UNOPS agreement proved unsuccessful in this role leading to huge shortages in the public sector. PhRMA member companies further experienced significant challenges with the UNOPS procurement process that negatively impacted commercial operations in Mexico and patient access to procured medicines. The system suffered from (1) fragmented management of the end-to-end process for procuring, supplying and distributing medicines due to non-interoperability between the Mexican Government and UNOPS; (2) logistical barriers for distributors and hospitals that lack needed information to verify and accept delivery of procured medicines; and (3) lack of transparency and meaningful engagement with affected stakeholders to resolve concerns.

As a result, in October 2022, the contract with UNOPS was terminated and INSABI resumed temporary control of purchasing. In early 2023, the President of Mexico presented a reform bill to the Organic Law of the Federal Public Administration to the House of Representatives. This bill seeks to centralize public procurement and spending in the Ministry of Public Administration (SFP). The SFP is additionally responsible for internal control, the prevention of acts of corruption and the oversight and evaluation of public administration.

These sweeping changes were made without meaningful stakeholder consultation, presented safety concerns and are further contributing to an unviable, confusing, non-transparent and uncertain business environment for PhRMA member companies.

- In January 2020, the Mexican Government published executive orders that would allow procurement and imports of medicines that have not been approved by COFEPRIS. Instead, the products will simply need regulatory approval from either (1) the country of origin; (2) regulatory authorities in Australia, Canada, Europe, Switzerland or the United States; (3) PAHO/WHO Regional Reference Authorities which additionally include Argentina, Brazil, Chile, Cuba and Colombia; or (4) any of the 53 authorities participating in the Pharmaceutical Inspection Cooperation Scheme (PIC/S). PhRMA has urged the Mexican Government to limit the procurement process to products that meet all relevant regulatory standards and to adopt specific measures to honor IP protections in the context of these approvals.

- Subsequently, in August 2020, the Mexican Government amended the Federal Procurement Law to permit the procurement of medications, vaccines and medical equipment directly from international organizations – such as the Pan American Health Organization (PAHO) and UNOPS – outside of Mexico’s normal procurement process. The legal changes apply to open tenders, restricted tendering, qualification of suppliers and selective tendering. They do not establish a clear methodology or government accountability for procurement through international organizations or include any specifications on how market research
will be conducted to determine whether it is appropriate and efficient to purchase medicines through international organizations. Nor do they ensure the protection of patent and other intellectual property rights by requiring exclusive procurements for patented medicines (e.g., UNOPS initially issued an open tender for molecules with intellectual property protection in Mexico). Moreover, the measure does not ensure that U.S. suppliers will be allowed to participate in the tenders. This exclusion opens a wide range of pharmaceutical procurements to being conducted outside of the normal legal framework.

- In September 2020, the Mexican House of Representatives began discussions to further amend the Federal Procurement Law. Discussions on these proposals are ongoing but do not appear to have considered Mexico’s government procurement commitments. On the contrary, many of the proposals deviate from those commitments and could become barriers to trade. For example, certain proposals suggest that market research provisions could be used to exclude tenders from certain countries, including the United States. This raises broad national treatment concerns as well as inconsistencies with Mexico’s government procurement commitments under the USMCA. The innovative biopharmaceutical industry is concerned that if these proposals are enacted, many of the benefits anticipated by U.S. manufacturers under the USMCA would be eliminated.

- In June 2021, the Executive Branch amended the implementing regulations of the Federal Procurement Law to permit the simultaneous supply in the purchase method known as the direct award, the equivalent to the limited tendering provided by the USMCA. That amendment may have the effect of circumventing public tendering, contrary to Mexico’s commitments under Chapter 13 of the USMCA (see below).

- Further, in November 2022, the CSG amended the regulations governing the Compendium to require applicants to obtain and submit a letter of necessity from at least one health institution member of the CSG for new medicines. The letter must explain why the medicine would satisfy the patient health needs identified by procuring entities. These new requirements and the lack of clear procedures for fulfilling them present new access barriers and were made without the public consultation process required by USMCA.

Under Chapter 13 of the USMCA, Mexico has generally committed to procure goods and services through open tendering procedures (Article 13.4.4). One of the limited exceptions to this commitment (Article 13.2.4) states that Chapter 13 does not apply to procurement conducted “under the particular procedure or condition of an international organization, or funded by international grants, loans, or other assistance if the applicable procedure or condition would be inconsistent with this Chapter.” While Article 13 enables government projects to allow for the participation of international organizations, it does not provide a mechanism for the Mexican Government to sidestep its USMCA commitments by procuring all products from an international organization. As such, the amendment to the Federal Procurement Law, which permits the direct procurement of
medicines with international organizations without restrictions, appears to exceed the limited exception provided by Article 13.2.4 of the USMCA.

Discussions on proposals to amend the Procurement Law are ongoing but do not appear to have considered Mexico’s government procurement commitments. On the contrary, many of the proposals deviate from those commitments and could become barriers to trade. For example, certain proposals suggest that “market research” provisions could be used to exclude tenders from certain countries, including the United States. This raises broad national treatment concerns as well as inconsistencies with Mexico’s government procurement commitments under the USMCA. The innovative biopharmaceutical industry is concerned that if these proposals are enacted, many of the benefits anticipated by U.S. manufacturers under the USMCA would be eliminated.

Since the implementation of this restructured procurement process, Mexico has experienced significant supply chain challenges, resulting in persistent shortages of medicines, including treatments for diabetes, hypertension, cancer and HIV. PhRMA member companies are deeply concerned that these continuing procurement changes and shifting implementation timelines could result in further shortages of medicines for Mexican patients and create concerns for pharmacovigilance and patient safety. Only 12 percent of new medicines launched globally since 2012 are publicly reimbursed in Mexico, with patients waiting an average of 55 months from global first launch for available medicines to become publicly reimbursed.  

Based on industry’s experience with these new procurement practices, as well as the nature of the proposed changes, PhRMA urges the Mexican Government to provide greater clarity in process and requirements, ensure consistency with Mexican law and international commitments and allow for appropriate lead times so that companies can make any necessary operational adjustments to ensure supply continuity.

Finally, recent Executive Branch modifications to the regulations of the Procurement Law permit governmental entities to circumvent the tendering process by procuring products and services (medicines included) through a direct award. PhRMA’s member companies are concerned that these modifications could lead to increased use of procurements with limited tenders, in violation of Mexico’s commitment to open tendering under USMCA.

\[369 \text{Id.}\]
NEW ZEALAND

PhRMA and its member companies operating in New Zealand remain concerned over the direction the New Zealand Government is taking with respect to the policies and operation of New Zealand’s publicly funded prescription medicines system as well as broader intellectual property (IP) protections. The prescription medicines ecosystem continues to impose stringent cost containment strategies and operates in a non-transparent manner, creating an unfavorable environment for innovative medicines.

Key Issues of Concern:

- **Government pricing and reimbursement**: Only 16 percent of new medicines launched globally since 2012 are available in New Zealand.\(^{371}\) The challenging reimbursement process, combined with a lack of funding, severely limits patient access and significantly delays funding for new medicines. An independent review of the Pharmaceutical Management Agency (PHARMAC) was released to the public in June 2022 and reflects many of the comments that industry submitted during the review process. Promisingly, the New Zealand Government indicated it will implement 31 of the 33 recommendations made by the review panel. While no timelines have been released for implementing these recommendations, industry stands ready to work with all relevant departments of the New Zealand Government to ensure that the recommendations are implemented in a manner that improves patient access and health outcomes.

- **Biotechnology taskforce recommendations**: Despite steps taken toward an enhanced relationship between the New Zealand Government and the research-based biopharmaceutical industry a decade ago, recommendations have not been implemented.

- **Amendments to the Patents Act 2013**: As part of the modernization of its IP laws, the Ministry of Business, Innovation and Employment (MBIE) has completed its consultation on amendments to several laws including the Patents Act (2013). However, MBIE’s recommendations to the New Zealand Government would limit innovators’ ability to secure and enjoy patent rights. For example, the proposed amendments seek to eliminate certain aspects of well-accepted and internationally recognized patent prosecution practice. Furthermore, the consultation and process failed to consider positive reforms such as patent term adjustment mechanisms to account for delays in patent processing or pharmaceutical patent term restoration to account for a portion of the time taken to secure marketing approval.

---

\(^{370}\) Government reference pricing and parity pricing; cross-therapeutic deals; tendering, principal supply contracts, price-volume contracts; special authority and restricted indications; delayed listing (on average three times longer than Australia) and no legislated timeframes for decision making or government oversight of transparency of decision-making processes.

• Therapeutic Products Bill: The Therapeutic Products Bill was released for public consultation in late 2019 to reform and replace the Medicines Act 1981 but has not progressed further. It contains many well aligned principles to modernize the legislation for future technologies such as gene and cell-based therapies. However, the bill does not take the opportunity to reform regulatory data protection (RDP) terms contained in the Medicines Act 1981. Proposed changes to the drafted legislation may also see the New Zealand government remove the innovative pharmaceutical industry’s ability to undertake direct to consumer advertising of branded prescription medicines, while allowing all other sectors (such as medical devices and over-the-counter medicines) to continue the practice. The significant fines and penalties that would apply to breaches of this legislation are deeply concerning, as it is unclear exactly what standards or guiding principles will be used to determine their application.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

Intellectual Property Protection

Amendments to the Patent Act (2013) and the Therapeutic Products Bill

PhRMA and its members are disappointed to see that the Therapeutic Products Bill and the proposed amendments to the Patents Act (2013) do not reflect needed reforms to enhance biopharmaceutical intellectual property protection in New Zealand.

As part of modernizing its intellectual property laws, MBIE initiated consultations on amendments to various laws, including the Patents Act (2013). However, the MBIE recommendations will limit unreasonably innovators’ ability to secure and enjoy patent rights. For example, MBIE seeks to eliminate the ability for patent applicants to file divisional applications based on prior divisional applications. MBIE also proposes to cease recognizing multiple and partial priorities within a single patent claim and to prohibit “Swiss” patent claim structures. These practices are recognized in top patent offices, including those in the United States and Europe.

While the Patents Act amendments appear contrary to international best patent practices, the modernization efforts also miss the opportunity to introduce positive reforms such as patent term adjustment to account for delays in patent processing and pharmaceutical patent term restoration to account for a portion of the lengthy development and regulatory approval process. Similarly, the proposed new medicines legislation – the Therapeutics Products Bill – does not reform New Zealand’s regulatory data protection regime to reflect international best standards. The bill does not seek to increase the RDP term for biologics, even though the period of protection for biologics in New Zealand (five years), is well below the OECD average. Conversely, in November 2016, New Zealand passed the Agricultural Compounds and Veterinary Medicines Amendment Act, which increased the RDP term for “innovative agricultural compounds” including veterinary medicines from five years to 10 years. Appropriately, this legislation was passed to allow
the New Zealand agricultural sector to gain greater access to innovative modern veterinary medicines from overseas. As New Zealand looks to update the Medicines Act (1981) and futureproof its health technology legislation to prepare for new medical technologies (e.g., gene therapies), we are hopeful that the government will reconsider its position and will similarly increase the RDP term for biologics to ensure that patients in New Zealand have greater access to innovative medicines in the future.

**Market Access**

**Government Pricing and Reimbursement**

Although not explicitly stated, New Zealand’s reimbursement decisions suggest a pharmaceutical product must achieve a cost per quality-adjusted life year (QALY) of less than NZ$10,000 to NZ$15,000 to be considered cost effective, despite public spending in other areas of health proceeding at up to NZ$100,000 per QALY. This approach, combined with the need to stay within a capped budget, means that many of the most effective medicines are not available to patients in New Zealand. In fact, only 16 percent of new medicines launched globally since 2012 are available in New Zealand, with patients waiting an average of 33 months from global first launch for the fewer medicines that become available. Further, only seven percent of new medicines are publicly reimbursed, placing New Zealand lowest of all OECD countries for the share of new medicines publicly reimbursed.372

Ongoing monitoring of the Pharmaceutical Schedule listing trends by New Zealand’s innovative pharmaceutical industry association, Medicines New Zealand, continues to show the lag in patient access. In June 2021, updated analysis showed that there were 118 medicine-indication pairs on the “medicines waiting list” that had been recommended for funding by PHARMAC’s Pharmacology and Therapeutics Advisory Committee (PTAC) as cost-effective treatments and yet not approved for reimbursement by PHARMAC. These medicines include treatments for rare diseases, diabetes, depression, breast, lung and prostate cancers, and rheumatoid arthritis. Approximately one third of the medicines have been on the waiting list for more than four years and 10 percent have been on the list for more than six years.373 This list has grown rapidly from 48 medicines in 2010 to the present level of 74 medicines. Despite modest increases in funding for the medicines budget from the New Zealand Government over the past few years, the increasing number of pharmaceuticals yet to receive public reimbursement decisions is a concern for the public health system, as well as for health care professionals and patients.

Despite the surprising omission of medicines from the full review of the Public Health and Disability System in 2019 and 2020, as well as the clear and significant challenges with the public reimbursement process for innovative medicines in New Zealand, the joint announcement by the Prime Minister and Minister of Health of an

373 PHARMAC, OIA response | Medicines on PHARMAC’s ranking list, Apr. 27, 2021.
independent review of PHARMAC on March 2, 2021, was a positive step. The review focused on how PHARMAC performs against its current objectives, whether and how its performance could be improved in order to maximize its potential to improve health outcomes for all New Zealanders as part of the wider health system and to also identify necessary changes to PHARMAC objectives. The review assessed: (i) the timeliness of PHARMAC’s decision making (in particular for new innovative medicines); (ii) the transparency and accessibility of decision-making processes; and (iii) equity, including access to medicines and devices for Māori and Pacific peoples. The final report was publicly released in June 2022 and reflected many of the comments that industry submitted during the review. In turn, the New Zealand Government indicated that it would implement 31 of the report’s 33 recommendations, including improving the governance, accountability and decision-making processes of PHARMAC. While no timelines have been released for implementing these recommendations, industry stands ready to work with all relevant departments of the government to ensure that the recommendations are implemented in a manner that improves patient access and health outcomes.

Biotechnology Taskforce Recommendations

The New Zealand Government’s Biotechnology Taskforce made the following recommendations in 2003 to enhance its relationship with the pharmaceutical industry and stimulate research investment:

- Introduce certainty and predictability into prescription pharmaceutical public funding by setting ongoing three-year funding allocations rather than year-to-year funding allocations from the Government budget.

- Develop a public policy action agenda for the industry building on the local industry association’s report “Bio-pharmaceuticals – A Pathway to Economic Growth.”

- Review the channels through which the Government engages with the pharmaceutical industry.

The first recommendation was achieved initially with an announcement in September 2004 of annual budgets through 2007. Unfortunately, this policy was rescinded and the subsequent budget for 2008-2010 was not published. To date, the Government has not implemented the second and third recommendations.

A Health Select Committee report in June 2011 recommended enhancing the engagement with the pharmaceutical industry around clinical research yet the Government declined to implement this recommendation. In a positive development, in 2012 the MBIE released a guideline on Government procurement. Among other recommendations, the guideline includes the following principles: (1) be accountable, transparent and reasonable; (2) make sure everyone involved in the process acts responsibly, lawfully and with integrity; (3) stay impartial – identify and manage conflicts of interest; and (4) protect suppliers’ commercially sensitive information and IP. These are the same principles that New Zealand should adopt as part of its pharmaceutical pricing and reimbursement system.
PhRMA member companies operating in the Philippines continue to face serious market access and intellectual property (IP) threats and are deeply concerned about the Philippines Government’s fading commitment to competitive markets. In particular, the Government is creating an unviable business environment that seeks to institutionalize government price controls, imposing mandatory price cuts of up to 50 percent with planned price cuts of up to 96 percent. The government also introduced a Suggested Retail Price (SRP) scheme with penalties for non-adherence. The impending price cuts, compulsory licensing proposals and a slow and burdensome regulatory process threaten patient access to innovative medicines in the Philippines.

**Key Issues of Concern:**

- **Government price controls:** Despite the passage of the Universal Healthcare (UHC) Act and National Integrated Cancer Control Act (NICCA) that both contain tools to reduce prices for medicines, the Department of Health (DoH) has imposed draconian price cuts through the Maximum Retail Price (MRP) policy. Issued in February 2020, the initial list covered 133 drug formulations with a mandatory price reduction of up to 56 percent from prevailing market prices. The policy also contains provisions to cover another set of 72 drug formulations, with initial price reduction proposals ranging from 50 percent up to a staggering 96 percent, despite calls to suspend such measures due to the COVID-19 pandemic. In March 2022, a second tranche of drugs were included in the list, bringing the total to 204 drug formulations. The DoH has stated that it intends to cover up to 54 percent of all prescription medicine formulations. The price cuts are estimated to decrease industry’s annual revenues by approximately PHP 57 billion. In addition to MRP, an SRP scheme was implemented with penalties for non-adherence and proposals for a Drug Price Regulatory Board are currently being discussed in the Congress.

- **Philippine National Formulary (PNF) and health technology assessment (HTA):** While industry supports the appropriate use of evidence to inform formulary decisions, the recent establishment of an onerous HTA process as a prerequisite for government procurement and reimbursement is further exacerbating existing delays in introducing innovative medicines to the market. Specifically, in August 2021, the DoH postponed the nomination process to March 2022, and once initiated, did not conclude the public comment period until September 2022. Furthermore, different stakeholders have raised issues and concerns regarding the HTA requirements and process making it difficult for new medicines to be admitted to the formulary. The HTA process is estimated to require up to two years for each product.

- **Regulatory hurdles:** In January 2021, the Philippines Food and Drug Administration (FDA) issued revised target timelines for the review and approval of applications for drug registrations. The new timelines range from 180 to 240
working days. However, the full regulatory review process will now take two to four years to complete.

- **Intellectual property protection:** The Cheaper Medicines Act amended the Philippines Intellectual Property Code to limit the patentability of new forms and uses of pharmaceutical products. The Act appears to be inconsistent with the World Trade Organization Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) since the limitation appears to be designed to discriminate against certain technologies. Additionally, the Philippines does not have a robust system or a set of coordinated procedures across relevant government agencies such as the Intellectual Property Office (IPOHPL) and the FDA to allow patent holders to resolve patent disputes effectively and efficiently prior to the marketing of generic copies of pharmaceutical products by third parties.

- **Compulsory licensing guidelines:** In May 2021, the DoH, Department of Trade and Industry (DTI), FDA and the IPOPHL jointly issued guidelines on the issuance of compulsory licenses (CLs). The Guidelines create significant legal uncertainty and appear inconsistent with international practice and rules.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Cheaper Medicines Act**

PhRMA members continue to have concerns that certain provisions in the Cheaper Medicines Act adversely affect effective protection of intellectual property and result in certain market access barriers. For example, certain provisions appear to create additional patentability requirements for new forms and uses of pharmaceutical products, thereby discriminating against the pharmaceutical sector, and raising questions as to its consistency with the TRIPS Agreement. There is also a need to engage the judiciary to ensure more consistent interpretation of intellectual property protections in the Philippines.

**Effective Patent Enforcement**

It is important that the Philippines adopt processes and mechanisms to allow for the efficient resolution of patent issues prior to the marketing of follow-on products by third parties. Such a mechanism was in place before a 2005 DoH Administrative Order (A.O. No. 2005-0001) took effect that required pharmaceutical patent holders to monitor follow-on products seeking FDA registration and to pursue costly and time-consuming legal remedies to avoid potential patent infringement. In February 2021, the House of Representatives introduced a draft bill that aims to amend the Intellectual Property Code of the Philippines. The local innovative pharmaceutical trade association, the Pharmaceutical and Healthcare Association of the Philippines (PHAP) recommended that
there should be a coordinated effort between the IPOPHL and the FDA to preclude the issuance of a Certificate of Product Registration for a follow-on medicine by FDA until the relevant patents on the originator product have expired, or there has been sufficient time for resolution of a patent infringement dispute. The bill was approved at the Committee level on September 15, 2021, and is now awaiting consideration by the full House.

**Compulsory Licensing Guidelines**

In May 2020, the DOH, DTI, FDA and IPOPHL issued joint guidelines on the Use of Special CLs and CLs. PhRMA and its member companies are concerned that the guidelines are inconsistent with international practice and the Philippines’ international obligations, in that they appear to be based on an erroneous understanding of TRIPS, allow for the grant of CLs on overly broad grounds, provide inadequate opportunity for patent holders to respond to CL petition and appeal CL grants, and discriminate against pharmaceutical patents.

PhRMA believes CL actions should be made only in exceptional circumstances and as a last resort. Decisions should be made through fair and transparent processes that involve participation by all stakeholders, consider all relevant facts and options, and in accordance with international rules.

**Market Access**

**Government Price Controls**

Despite the recent passage of the UHC Act and NICCA that both contain tools to reduce prices for medicines, the DoH has imposed draconian price cuts through the MRP. Issued by President Rodrigo Duterte in February 2020, Executive Order No. 104, entitled “Improving Access to Healthcare through the Regulation of Prices in the Retail of Drugs and Medicines,” covers an initial list of 133 drug formulations with a mandatory price reduction of up to 56 percent from prevailing market prices. The policy also contains provisions to cover another set of 71 drug formulations, with initial price reduction proposals ranging from 50 percent up to a staggering 96 percent, despite calls to suspend such measures due to the impact of COVID-19 on the industry. In March 2022, the second tranche of drugs were included in the list, bringing the total to 204 drug formulations. The combined list includes medicines for hypertension, diabetes, cardiovascular disease, chronic lung diseases, neonatal diseases, major cancers, chronic renal disease, psoriasis and rheumatoid arthritis, among others.

The DoH indicates that it intends to control prices for 1,154 to 2,394 formulations or 26 to 54 percent of all prescription medicines in the market. The local innovative biopharmaceutical trade association (PHAP) estimates that this could reduce annual industry revenues by approximately PHP 57 billion if fully implemented.

To fully operationalize this plan, the DoH released in August 2020 guidelines to implement MRP under Administrative Order No. 2020-0039. The AO includes: (1) the
constitution of a Drug Price Advisory Council, responsible for drug price evaluations and for recommending which drugs will be under price regulation and at what level; (2) the medicine review process, including the basket of countries for international reference pricing, medicine selection algorithm (incorporating public nomination of medicines for MRP) and formula for calculating MWP and MRP; (3) implementation guidelines, including exhaustion of inventory, publication and posting requirements; and (4) monitoring and impact assessment.

As part of these actions to move away from allowing the competitive market to determine prices in the Philippines, the DoH has also proposed to the Congress the creation of a Drug Price Regulatory Board to oversee and expand the use of the MRP mechanism. This proposal is currently pending legislative decision.

While the MRP policy intends to improve access to covered medicines, a national impact assessment study involving doctors, patients and the industry showed serious negative consequences that would run counter to this goal. This includes declining volume and value of the biopharmaceutical market after MRP implementation, product withdrawals, a reduction in planned entries of new medicines, employee lay-offs, negative changes in business models, discontinuation of certain investments and a reduction in clinical trials, corporate social responsibility and patient access programs.

The government also implemented an SRP scheme for medicines. While the Price Act clarifies that SRP is “for the information and guidance of producers, manufacturers, traders, dealers, sellers, retailers, and consumers”, the SRPs are grossly below the prevailing market prices and there are penalties for non-adherence.

In addition to the MRP and SRP policy, the Philippines continues to mandate discounts for certain patient populations, such as senior citizens, persons with disabilities, national athletes, single parents and many others. Ambiguities in the implementation of laws related to the 20 percent discount granted to senior citizens and persons with disabilities have resulted in the cost of the discount being borne entirely by manufacturers and retailers, disproportionately burdening PhRMA member companies.

Finally, PhRMA is encouraged to see inclusion of private sector special access schemes included in the National Integrated Cancer Control Act, illustrating more viable alternatives to price controls to increase patient access to oncology drugs. PhRMA welcomes guidelines to operationalize these schemes and encourages the government to engage with industry in their creation and implementation.

Guidelines on Price Negotiation

In January, the guidelines were issued on price negotiation for innovative, proprietary, patented and single source products. This is in line with the mandate of the UHC Act to create a Price Negotiation Board (PNB), which would negotiate prices on behalf of the DoH and PhilHealth, a corporation attached to DoH in charge of managing the country’s social health insurance. A Rules of Procedures was also issued, describing
how the negotiations will be conducted. The PNB was established in February 2021. Further price controls will impose an additional burden on industry, hindering recovery from the downturn triggered by the pandemic. The DOH has yet to finalize the list of drugs that will be subject to negotiation.

It is critical that the negotiation criteria, pooling of orders across different facilities, budget allocation and target population are developed through meaningful consultations with affected stakeholders and clearly identified before negotiations begin. PhRMA member companies are also concerned by the unclear use of international reference pricing and benchmarking against highly developed countries, wherein the Philippines Government automatically rejects the product from addition to the formulary where the price is deemed to be too high.

As such, PhRMA’s members strongly encourage the government to consider facilitating access to public funding through measures such as accelerated formulary inclusion, alternative lists, government procurement and multi-year contracts.

The Philippine National Formulary and Health Technology Assessment

While PhRMA members support the appropriate use of evidence to inform formulary decisions, existing delays in introducing innovative medicines could be further exacerbated by the recent establishment of HTA as a prerequisite for PNF inclusion and subsequent government procurement and reimbursement. Specifically, in August 2021, the DoH postponed the nomination process to March 2022, citing various issues including the ongoing pandemic. The process was eventually concluded in September 2022 and an initial list of criteria released. The delay further deprived patients access to new medicines.

Furthermore, different stakeholders have raised issues and concerns regarding the onerous HTA requirements and process that make it difficult for new medicines to be admitted to the formulary, including the use of clinical practice guidelines, operationalization of the HTA Research Network, requirement of completed Phase IV clinical trials, use of real-world data and evidence and the use of low cost per quality-adjusted life year thresholds, especially for cancer and orphan drugs. The HTA process is estimated to require up to two years for each product, substantially delaying patient access to innovative medicines. Finally, the HTA function was transferred from the Department of Health to the Department of Science and Technology, potentially complicating the process and exacerbating these delays.

Only 13 percent of new medicines launched globally since 2012 are available in the Philippines. Over the past five years, patient access to new medicines has worsened in the Philippines more than in any other Asia-Pacific country. Five years ago, 22 percent of new medicines launched globally over the prior ten years were available in the Philippines; today, only 13 percent of new medicines launched globally over the prior

It is imperative, therefore, that the Government establishes a fit-for-purpose, transparent and efficient PNF listing process.

**New Product Registration**

In January of this year, the FDA issued revised target timelines for the review and approval of applications for registration. The new timelines range from 180 to 240 working days with cancer products taking the longest. However, PhRMA member companies report that the process takes two to four years.

One issue identified is the use of a single registration process for all types of products. Like other similarly situated regulatory authorities, industry strongly encourages the FDA to establish abridged regulatory processes, such as reliance schemes and other expedited processes, to help reduce the FDA’s regulatory burden and more efficiently approve new products, particularly where those products have been approved by stringent regulatory authorities to respond to a public health emergency or address an unmet need.

**Counterfeit Medicines**

The Philippines Government continues to expand its anti-counterfeiting activities in partnership with PhRMA member companies and raise public awareness regarding the dangers of unsafe medicines. Nonetheless, according to a report by the United Nations Office on Drugs and Crime released in 2019, around 193 of 673 counterfeit crimes reported from 2013 to 2017 in Southeast Asia were perpetrated in the Philippines, the highest in the region.

In addition, the pandemic highlighted the proliferation of unauthorized online sellers of prescription medicines and vaccines. PhRMA’s member companies are concerned that medicines procured through these outlets may be counterfeit and/or inappropriately handled, thereby jeopardizing patient safety.

375 *Id.*
RUSSIA

PhRMA and its member companies condemn the invasion of Ukraine and the suffering it continues to cause. Overcoming the challenges that this humanitarian crisis poses for patients is our primary concern. We are united in our mission of providing treatments and vaccines to all those affected by the war, wherever they are. We remain deeply concerned about the deteriorating regulatory environment and the impact that it is and will continue to have on patients. Recognizing the current reduced ability of the U.S. Government to engage on these issues, we provide below only a summary of key concerns most impeding industry’s ability to ensure that Russian patients continue to have access to medicines. The full range of issues identified in PhRMA’s previous comments (e.g., on last year’s National Trade Estimate Report) remain significant concerns.

**Key Issues of Concern:**

- **Compulsory licensing:** Over the last few years several actions have been taken at the legislative, executive and judicial level to facilitate compulsory licensing in Russia. This includes passage of federal legislation to allow for the issuance of CLs both for use in Russia and for export, as well as the imposition of a CL at the end of 2020 (via Decree No. 3718-r) on a COVID-19 therapeutic. Similarly, PhRMA members are witnessing a rising trend in court cases seeking CLs for dependent patents. Russian courts, in at least two cases, have granted CLs to generic companies for innovative foreign medicines based on an extremely low evidence test and standard of proof. In 2022, the Russian Government amended the Civil Code to penalize right holders from “unfriendly” countries that imposed sanctions against Russia by eliminating any compensation in the event a CL is issued (Decree No. 299 dated March 6, 2022).

- **Weak patent enforcement:** Russian courts rarely grant preliminary injunctions in patent infringement cases related to pharmaceuticals. As a result, biopharmaceutical innovators face significant legal challenges in seeking to effectively protect their innovative products against infringement, resulting in significant damages that are rarely compensable. This practice is out of step with the rest of the world and considerably weakens Russia’s IP protection regime. There is no effective mechanism in place in Russia to provide patent holders with an opportunity to resolve patent disputes prior to the launch of a follow-on product. This has led to the approval and marketing of follow-on products during the period of patent protection. Given these problems, PhRMA and its member companies are encouraged by recent legislative proposals to implement a Unified Register of Active Pharmacological Substances Protected by Patents. All necessary medicine patents should be included in the register in order to ensure its utility and effectiveness.

- **Localization barriers and government procurement restrictions:** Despite being in the process of acceding to the WTO Agreement on Government
Procurement (GPA), Russia continues to pressure local production of medicines through its government procurement system (e.g., restrictions on public procurement of imported medicines where there are at least two pharmaceuticals with locally produced finished dosage forms, so-called the “three’s a crowd” rule), and as of 2019, a 25 percent price preference for products for which all stages of production are carried out locally. If the “three’s a crowd” rule is not applicable, a 15 percent price preference is applied. Moreover, in August 2020, Russia released a list of more than 200 “strategically important medicines” that must be produced in Russia. Since November 2021, there have been discussions of a decree that would introduce a “two’s a crowd” rule for the public procurement of medicines. The “two’s a crowd” rule implies that if during the public tender of strategically important medicines an application is submitted with the full production cycle in EAEU (starting with the synthesis of the active pharmaceutical ingredient), the government procurer must reject all other applications. According to the current draft, the rule would be applied to all 215 medicines from the list of strategically important medicines. The mechanism is intended to be implemented in September 2024. The Russian Government aims to establish “medicines sovereignty” by 2030, defined as domestic production of 75 percent of the market by value and 85 percent of the market by volume for biopharmaceutical and diagnostic products.

- **Government subsidies to Russian manufacturers and exporters**: Russian authorities are pursuing various mechanisms to support Russian biopharmaceutical manufacturers and suppliers. These include Government Decree No. 1347 dated July 28, 2022, which provided manufacturers and suppliers of high-tech products with government subsidies for up to 80 percent of the costs of export transportation until November 2024. The Russian government also established subsidies for the development of biopharmaceutical product analogues protected by patents owned by persons and organizations from countries implementing sanctions against Russia (amendments made by Decree No. 529 dated April 3, 2023, to Decree No. 1649 dated December 12, 2019).

- **Deteriorating government pricing environment**: In October 2018, a new pricing methodology for products included on Russia’s Essential Drug List (EDL) came into force that skews ceiling price calculations toward the lowest international price. In addition, in December 2019, the Russian Government approved Resolution No. 1683 that mandated re-registration of all maximum selling prices for EDL medicines. More recently, the Russian Government introduced the right to exercise specific price control measures on medicines not included in the EDL.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.
SAUDI ARABIA

PhRMA and its member companies welcomed Saudi Arabia’s bold “Vision 2030” plan, which aims to transform the country into “a vibrant society, a thriving economy and an ambitious nation” by the year 2030.\textsuperscript{376} Biopharmaceutical innovators have sought to engage SAIP and the relevant ministries to establish an IP regime in Saudi Arabia that can achieve the bold goals of Vision 2030.\textsuperscript{377} Actions by SFDA, including authorizing generic medicines that rely unfairly on innovator regulatory data or during the term of relevant patents, undermine these positive developments and the investment climate in Saudi Arabia. SAIP issued compulsory licensing guidelines in 2019 and proposed regulations in 2020 on regulatory data protection (RDP) that further weaken – rather than improve – IP protections in the Kingdom. To date, SAIP has yet to finalize RDP regulations. Similarly, SFDA issued in November 2022 its final “Procedure to Deal with Patents When Registering Generic Products with the Saudi Food and Drug Authority” (“Procedure”). Despite recognizing the need to ensure patents are respected when considering generic applications, the Procedure falls woefully short of the mechanisms needed to provide effective enforcement of biopharmaceutical patents.

Key Issues of Concern:

- **Ineffective patent protection, patent enforcement and RDP:** In mid-2017, the SFDA started granting marketing approval to generic versions of innovative medicines during the term of the patent(s) protecting those treatments or the period of RDP. SFDA’s repeated approval and related price listings of generic copies of innovative medicines is contrary to Saudi Arabia’s own patent enforcement and data protection rules. These actions also contradict the country’s World Trade Organization (WTO) commitments. SAIP missed a significant opportunity to ensure effective patent enforcement in its final Procedure published on November 28, 2022. While taking some steps to improve patent enforcement, that Procedure falls short of ensuring effective patent enforcement in the Kingdom and exacerbates future risks of improper SFDA approvals of patent infringing follow-on products. SAIP has issued proposed regulations on compulsory licensing and RDP that have further weakened or would further weaken IP protections in Saudi Arabia.

- **Government procurement lacks transparency and discriminates against foreign manufacturers:** Frequent renegotiation of tenders, combined with the lack of clear timelines, have resulted in an unpredictable government procurement system. The recent creation of the Local Content and Government Procurement...
Authority (LCGPA) to identify lists of products that must be procured from local manufacturers, combined with up to 30 percent price preferences for medicines made with locally manufactured active pharmaceutical ingredients (API), serve to discriminate against foreign manufacturers and increase uncertainty in the Saudi market. Further complicating matters, in November 2022, the LCGPA released, without public consultation or private sector input, the Economic Participation Policy mandating that foreign companies locally invest 35 percent of the value (based on certain multipliers) of any government tender fulfilled with more than 100 million Saudi Riyal of imported products. In addition, in February 2021, the Ministry of Investment announced that multinational companies must establish their Regional Headquarters in Saudi Arabia to be eligible to participate in government tenders. This requirement was endorsed by a royal decree in December 2022.

- **Pricing guidelines do not appropriately value innovative medicines:** The SFDA pricing guidelines set prices for medicines in Saudi Arabia based on prices in a basket of reference countries, in practice taking the lowest price and subsequently imposing other re-pricing rules. This flawed methodology does not appropriately recognize the value of innovative medicines for the Saudi health system and patients. Although SFDA reduced the basket of reference countries from 30 to 16 countries, it still includes countries with very different health care and reimbursement systems. While the revised guidelines are a step forward compared to earlier drafts, the current rules are inconsistent with Saudi Arabia’s vision to incentivize innovation and establish a more value-based approach to health care. Some efforts to enhance the pricing process include the option of registering products for tender only with an exemption from pricing.

- **Ensuring the new health technology assessment system supports value-based health care:** Industry stands ready to work with the Saudi authorities to ensure that the new health technology assessment (HTA) system is not used exclusively as a cost-containment tool, but rather supports timely Saudi patient access to innovative medicines and moves the country towards the value-based health care system outlined in the Saudi Health Sector Transformation Strategy.

- **New Council of Health Insurance (CHI) Policy risks patient affordability, product choice and investment:** In October 2022, the CHI issued a new policy for private sector health plans that sets co-payments for generics at 20 percent of the product price up to a maximum of $8 versus co-payments for off-patent original brands at 50 percent of the product price with no maximum. In addition, the guidelines mandate the dispensing of generic products. This large and sudden change will substantially decrease the affordability of off-patent original brands for patients. It will also immediately threaten roughly half of originator company revenues in Saudi Arabia as well as local manufacturing infrastructure investments and other local partnerships often required by the government to participate in government tenders.
For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Ineffective Patent Protection, Patent Enforcement and RDP**

Despite creating mechanisms to provide for effective patent enforcement and RDP, in mid-2017 the SFDA started granting marketing authorization to domestic drug companies to produce copies of innovative medicines produced in the United States and other countries during the period of patent or RDP protection. Furthermore, the National Unified Procurement Company for Medical Supplies (NUPCO) has proceeded to procure the potentially infringing products despite multiple appeals from the relevant innovators and, in one case, despite a favorable Saudi court decision. The local drug companies are now distributing these copies to the MoH and selected hospitals. Despite Saudi Arabia being on the Priority Watch List between 2019-2021 and multiple political commitments to solve ongoing cases, rather than end this practice, SFDA is actively soliciting on its website for manufacturers to seek approval for generic products even where the innovative product is still subject to IP protections, including RDP.

SFDA’s actions appear designed to benefit Saudi Arabia’s local industry, as evidenced by the tenders awarded by NUPCO. These actions harm U.S. manufacturers, potentially infringe proprietary technology and damage U.S. exports. Contrary to the country’s aspirations to promote local investment, IP infringement and the lack of effective enforcement sends a hostile message to U.S. inventors and investors that their valuable IP rights are not secure in Saudi Arabia.

These actions also appear contrary to Saudi law and to Saudi Arabia’s WTO commitments. For example, Article 5 of a Council of Ministers’ Trade Secrets Protection Regulation (decision No. 3218, dated 25/03/1426 H, May 4, 2005), as amended by Ministerial Decision No. 431 of 1.5.1426H (June 8, 2005) states that the submission of confidential tests or other data, obtained as a result of substantial efforts, for the approval of the marketing of drugs or agricultural products which utilize a new chemical entity, shall be protected by the competent authority against unfair commercial use for at least five years from the approval date. Unfortunately, the Kingdom of Saudi Arabia has not complied with its own regulation and WTO commitments which gave rise to the regulations. Specifically, Saudi Arabia confirmed during its accession to the WTO that:

> [Its] Regulations provided for protection of undisclosed tests and other data submitted to obtain approval of a pharmaceutical or agricultural chemical against unfair commercial use for a minimum period of five years from the date of obtaining the approval including the establishment of the base price. No person other than the person who submitted such data could, without the explicit consent of the person who submitted the data, rely on such data in support of an application for product approval. Any subsequent application for
marketing approval would not be granted a market authorization unless the applicant submitted its own data, meeting the same requirements applied to the initial applicant, or had the permission of the person initially submitting the data to rely on such data.378

The WTO Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) imposes more than a non-disclosure obligation. Rather, TRIPS Article 39.3 additionally requires WTO Member States to prevent “unfair commercial use” of data generated by others. This is fulfilled by preventing reliance on regulatory test data and approvals based on such data for a fixed period of time. In other words, protected data may not be used to support marketing approval for follow-on products for a set amount of time unless authorized by the original submitter of the data. Unfortunately, the SFDA is interpreting the Saudi Regulations in a restrictive way limited to non-disclosure that allows it to rely on the innovator’s regulatory data or limited data published in scientific journals.

In September 2020, SAIP published new draft regulations for the protection of confidential business information, including regulatory test data. Far from improving on a prior draft issued in 2019, the new draft would further weaken RDP in Saudi Arabia. Among other things, the draft contains a general provision on RDP without specifying the term of protection and explicitly states that reliance on the clinical data package submitted by the innovator to SFDA does not constitute unfair commercial use. The draft also lacks clarity with respect to the scope of products covered, contains overly broad exceptions to RDP and continues to lack the necessary mechanisms for effective enforcement.

In addition to making no progress on RDP, in April 2020, SAIP issued damaging final regulations on the compulsory licensing of patents, which have the potential to frustrate Saudi Arabia’s efforts to promote innovation and economic growth. The final regulations largely disregard comments biopharmaceutical innovators provided on draft regulations SAIP published in July 2019. PhRMA believes governments should grant compulsory licenses (CLs) in accordance with international rules and only in exceptional circumstances and as a last resort. Decisions should be made through fair and transparent processes that involve participation by all stakeholders and consider all relevant facts and options. By allowing SAIP to take patents away three years after they are lawfully granted for almost any reason and without prior notice to the patent holder, the regulations risk encouraging excessive use of CLs and denying patent holders the right to adequately defend their property interests.

After signaling in 2020 positive intentions to strengthen patent protection through a new initiative on protecting IP, SAIP missed a significant opportunity to ensure effective and efficient patent enforcement in the Kingdom. On November 28, 2022, SFDA issued its final Procedure, which went into effect on January 1, 2023. While the Procedure recognizes the need to ensure that patents are respected when considering generic

applications for marketing authorization, it falls woefully short of the mechanisms needed to provide effective and efficient enforcement of biopharmaceutical patents. The Procedure includes a mechanism for innovators to report their patents (including patents issued by the Gulf Cooperation Council (GCC) Patent Office), and requires generic applicants to obtain a “Freedom to Operate” statement from a licensed IP agent before they can apply for a marketing authorization from the SFDA. However, right holders have a short timeframe of 30 days to report their patents and the Procedure does not: anticipate the availability of provisional enforcement measures, include measures to facilitate the timely resolution of patent disputes and establish a notification system – all of which are common practice in many other countries with robust IP protections.

Biopharmaceutical innovators have repeatedly engaged or sought to engage SAIP and other relevant Saudi ministries to address these concerns and to improve IP protection in the Kingdom. While some good progress has been achieved, PhRMA will continue engaging with and maintaining an open dialogue with the Saudi authorities to best improve the IP environment in the country. The recently announced National IP Strategy is an important opportunity to achieve this goal and PhRMA looks forward to engaging on the concrete measures falling under this strategy. In particular, PhRMA urges SAIP to work towards finalizing robust regulations on the enforcement of RDP. Initial draft regulations were published in 2020, but the process appears to have since stalled – subjecting PhRMA members to significant uncertainty on the extent of RDP in Saudi Arabia.

Market Access

Government Procurement Lacks Transparency and Discriminates Against Foreign Manufacturers

The government procurement of pharmaceuticals in Saudi Arabia presents many challenges. Although the tendering system is supposed to be closed, the practice of routine price renegotiations limit predictability, sustainability and fair competition. The lack of clear timelines for the procurement process hinders the ability of companies to plan and invest in bringing new medicines to the market and exposes Saudi Arabia to the risk of supply shortages. In addition, Saudi Arabia recently adopted a newly designed therapeutic class review process, whereby only a single product is identified for inclusion on formularies and for procurement. Such approaches unduly restrict patient and physician choice in identifying the most appropriate treatment for each patient. Finally, contrary to current practice, NUPCO should not disclose confidential negotiated net prices as it harms competition and access to innovation.

In addition to these deficiencies in the procurement process, Saudi Arabia recently constituted the LCGPA to identify lists of products that government institutions must procure from local manufacturers. The first list of products has been released and it identifies more than 100 medicines that are limited to local providers. Additionally, Saudi Arabia recently announced a price preference initiative of up to 30 percent for 42 locally manufactured products made using API manufactured in the country. These actions
discriminate against foreign manufacturers and increase uncertainty in the Saudi market. Further complicating matters, in November 2022, the LCGPA released, without public consultation or private sector input, the Economic Participation Policy mandating that foreign companies locally invest 35 percent of the value (based on certain multipliers) of any government tender fulfilled with more than 100 million Saudi Riyal of imported products. In addition, in February 2021, the Ministry of Investment announced that multinational companies must establish their Regional Headquarters in Saudi Arabia to be eligible to participate in government tenders. This requirement was endorsed by a royal decree in December 2022.

Pricing Guidelines Do Not Appropriately Value Innovative Medicines

The SFDA relies heavily on international reference pricing (IRP) to set the prices of medicines, in practice taking the lowest price from a basket of reference countries and subsequently imposing other re-pricing rules. IRP suffers from serious flaws as a mechanism for pharmaceutical pricing. It assumes similarity across countries in the reference basket and implicitly imports the pricing policies of those countries without accounting for circumstances that justify price differentiation. Importantly, IRP ignores the local value of medicines by ignoring the local standards of care, patterns of disease burden and socioeconomic factors. IRP also imports circumstances unrelated to a product’s value, such as budget overruns in reference countries that lead to government price cuts. Overall, while 85 percent of new medicines launched globally since 2012 are available in the United States, just 38 percent are available in Saudi Arabia, with Saudi patients waiting an average of 31 months from global first launch for the fewer new medicines that become available.\(^\text{379}\)

In August 2020, SFDA issued draft pricing regulations that would have compounded many flaws in the existing system. Following consultation with industry, a new version of the guidelines was implemented in January 2021 that makes several improvements over the draft version that will increase transparency and predictability. These included reducing the number of countries in the reference basket from 30 to 20 countries, limiting the circumstances for repricing after two years (with five years remaining the rule), and capping price reductions at 30 percent. Additionally, in July 2022, the SFDA further reduced the number of countries in the reference basket to 16, although several countries with very different health care and reimbursement systems remain in the basket. While the system still does not appropriately value innovation and several provisions still require clarification, the industry acknowledges that these changes are a step forward.

Ensuring the New HTA System Supports Value-based Health Care

Saudi Arabia is intensifying efforts to establish a formal HTA system. The Saudi HTA Center was established and a pilot program was announced in 2020 with voluntary submissions focused on innovative medicines in certain therapeutic areas (e.g., rare

disease, oncology and HIV). Subsequently, in August 2021, a new HTA department was created under the MoH and is expected to be the leading body for HTA in the country. Nevertheless, the previously created HTA Center continues to exist, creating a certain level of confusion.

When designed well and used appropriately, HTA of medical tests, treatments and health care services can represent one of many tools to support well-informed, patient-centered health care. When misapplied, HTA has the potential to impose one-size-fits-all policies that impede patients’ and physicians’ ability to tailor care to individual needs and preferences. Poor forms of HTA can also hinder progress in developing innovative new therapies that address unmet medical needs.

PhRMA and its member companies recognize the ongoing efforts of the Saudi authorities to build an HTA system and stand ready to offer their expertise based on international experience. While we appreciate that the primary goal is to inform decisions on effective use of resources, it is critical that HTA not be used as a cost-containment tool, but rather be designed to improve patient choice and access. In the context of ongoing discussions on economic assessments and cost-effectiveness thresholds, PhRMA calls for a collaborative dialogue with all relevant stakeholders, as implementing restrictive assessment methods will inevitably create barriers to patient access. PhRMA members are particularly concerned about the planned introduction of a cost-effectiveness threshold that may be set at an excessively low level relative to Saudi Arabia’s GDP per capita, threatening patient access to innovative therapies by failing to recognize the value of innovation. Moreover, rather than overlaying the proposed HTA system on the already complex pricing and reimbursement framework, PhRMA recommends that the new HTA system progressively replace certain features of the existing system – including IRP and the current tendering process – that are incompatible with the value-based health care approach that Saudi Arabia aims to achieve through its Health Sector Transformation Strategy.

PhRMA welcomes the future announcement of a clearer roadmap for the implementation of HTA, alongside the creation of the HTA Department within the MoH. There is a need for greater transparency and predictability surrounding the HTA requirements and process, including more specific timelines for the implementation of the different phases foreseen in the future roadmap. PhRMA therefore encourages the newly established HTA department to continue engaging PhRMA member companies in an open dialogue and seek their support to inform a fit-for-purpose HTA framework for the country.

New CHI Policy Risks Patient Affordability, Product Choice and Investment

In October 2022, the CHI issued a new policy for private sector health plans that risks patient affordability, product choice and current SFDA and Ministry of Investment priorities to encourage investment from the innovative biopharmaceutical industry. The new policy will set private-sector health plan co-payments for generics at 20 percent of the product price up to a maximum of $8. In contrast, co-payments for off-patent original
brands will be set at 50 percent of the product price with no maximum. In addition, the
guidelines mandate the dispensing of generic products. This large and sudden change
will substantially decrease the affordability of off-patent original brands for patients. It will
also immediately threaten roughly half of originator company revenues in Saudi Arabia
as well as local manufacturing infrastructure investments and other local partnerships
often required by the government to participate in government tenders.

PhRMA and its members support policies that improve the efficiency of markets
for off-patent medicines to create budget headroom for innovative medicines. However,
the current policy would create a sudden shock to originators without improving patient
affordability or establishing funding for innovative medicines that SFDA seeks to attract.
SINGAPORE

PhRMA member companies face several market access barriers in Singapore despite the country otherwise serving as a strong model for protecting intellectual property (IP), supporting clinical trials and incentivizing manufacturing. With continued collaboration between PhRMA member companies and the Singapore Government, and with U.S. Government support, the innovative biopharmaceutical industry is confident that we can resolve outstanding issues and strengthen the country’s business environment.

Key Issues of Concern:

- **Formulary listing practices in the public sector**: Singapore’s formulary listing process lacks consistency and transparency. Public hospitals and clinics maintain independent formularies based on undisclosed criteria and varied timelines, and listings can only be initiated by physicians, not manufacturers. At a national level, industry acknowledges efforts to expedite funding considerations in tandem with regulatory timelines, beginning with an oncology pilot program that allows manufacturer-led submissions as of 2021. While industry welcomes this change, very few companies have participated in these manufacturer-led submissions because of the high costs and uncertainty about the process and outcomes.

- **Government drug subsidies**: The Agency for Care Effectiveness (ACE) is the national health technology assessment (HTA) agency that conducts drug evaluations to recommend government subsidy decisions for medicines and produces guidance on their appropriate use in public hospitals and institutions. Further opportunities remain to make this process more timely, transparent and consultative, as well as to expand the scope of medicines considered for subsidy. A major overhaul of cancer treatment funding was implemented in September 2022, resulting in a positive subsidy list, the Cancer Drug List (CDL), of treatments approved by ACE. Exclusion of new cancer treatments not yet approved by ACE, plus some previously-approved cancer treatments, from the CDL may result in significant delays in patient access, disruption in continuity of care, and a decrease in the current standard of care for oncology. There continues to be a need for the government to recognize the value of new innovative treatments in this process.

- **Challenges in conducting clinical trials**: Singapore is consistently recognized as a leading location to conduct clinical trials as a result of its high-quality sites and renowned researchers. However, the high cost and administrative complications for setting up clinical trials in Singapore are observed as key barriers. In addition, patients enrolled in clinical studies are charged at private patient rates. Some efforts coordinated by the Singapore Clinical Research Institute (SCRI) are underway to reduce administrative complications in setting up clinical trials. It remains to be seen if these efforts will improve the speed and efficiency in setting up new clinical trials.
• **Intellectual property protection**: Singapore generally maintains a strong IP protection and enforcement system. However, Singapore artificially limits patent term restoration (PTR) for biopharmaceutical inventions to the product registration period in Singapore, even when that registration relies on clinical trials conducted outside of Singapore. Improvements to the manner in which Singapore provides PTR, as well as its data protection regime would support the country’s goal of becoming a global hub for biomedical innovation.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

Singapore generally maintains a strong IP protection and enforcement system. PhRMA members fully support the country’s objective of and progress toward becoming a global hub for biomedical science and innovation. To fully realize this goal, and in keeping with the U.S.-Singapore Free Trade Agreement, which will be celebrating its 20th anniversary in 2024, Singapore should adjust its PTR mechanism to compensate the patent holder for the time invested in conducting clinical trials either in Singapore or in any other market when such data is a condition of obtaining marketing approval in Singapore.

In addition, PhRMA continues to urge Singapore to improve its regulatory data protection (RDP) regime. In particular, Singapore should extend RDP to new formulations, combinations, indications and dosage regimens to continue to incentivize innovative biopharmaceutical research and development that will serve the country’s public health interests. As Singapore seeks to improve access to chronic diseases medicines as part of its population healthcare reform strategy, Healthier SG (HSG), robust RDP policies will help incentivize the development of new medicines tailored to local population needs and increase access to new medicines.

**Market Access**

Singapore has earned a reputation as an innovation hub for biopharmaceutical R&D and manufacturing. However, there must also be demand for innovative products, which means the health care sector and the whole-of-government needs to recognize the value of medical innovations. Singapore currently risks falling behind due to the methods the government is using to determine the value of new medicines. PhRMA member companies are committed to working with the Singapore Government to develop policies that will ensure patient access to current and future medicines and cement the country’s position as an innovation hub.

**Formulary Listing Practices in the Public Sector**

Public hospital listings rely on annual physician-led decisions and submissions to initiate the process, which can result in delayed patient access. At a national level,
industry acknowledges recent efforts to expedite funding considerations in tandem with regulatory timelines, beginning with an oncology pilot program that allows manufacturer-led submissions as of January 2021. The Singapore government intends to expand the manufacturer-led submissions process to non-cancer drugs as well. While industry welcomes this change, companies have not actively participated in these manufacturer-led submissions due to the high costs of producing the submission materials and the uncertainty about the assessment methods that will be used. PhRMA encourages a more transparent process with industry engagement to ensure the success of manufacturer-led submissions going forward.

Moreover, industry engagement in the formulary evaluation and policy decision-making process can be improved. PhRMA and its member companies believe that such measures will enhance consistency and transparency of the listing process in public formularies and a broader range of medicinal choices will create more effective treatment options for patients and physicians in public institutions.

**Government Drug Subsidies**

Established by the MoH, ACE is the national HTA agency in Singapore that conducts drug evaluations to recommend government subsidy decisions for medicines and produces guidance on their appropriate use in public health care settings and institutions. PhRMA member companies recognize ACE’s effort to improve engagement with industry during the listing and subsidy decision-making process, with broader public engagement also being considered. Such moves toward greater engagement and transparency will enhance the quality of submissions and the speed of decisions, thereby expediting patient access to innovative new treatments and vaccines in the public sector.

With just 27 percent of new medicines launched globally since 2012 available in Singapore and patients waiting an average of 25 months from global first launch for the medicines that become available, there is also an opportunity for government subsidies to be provided on a more timely basis and for a greater number of treatments and vaccines. The current process, a physician-led pathway, typically considers only one or two medicines for subsidy listing, with a third medicine on an exceptional basis, greatly reducing the treatment options for patients and physicians. This protracted but mandatory review process that involves Drug Advisory Council meetings for final decisions inevitably impacts patient access to innovation.

On November 1, 2020, the government announced that it would enhance subsidies for all vaccines included in the National Adult Immunization and Childhood Immunization schedules in line with recommendations from the Healthy SG Task Force. Beginning in July 2023, the government fully subsidized all nationally recommended vaccinations under the National Adult Immunization Schedule (NAIS) for Healthier SG (HSG)-enrolled citizens. These positive actions should increase vaccination rates by reducing out-of-pocket expenses. However, strong concerns remain on price confidentiality. PhRMA

---

member companies engaged with the MoH in a good faith understanding that price confidentiality would be observed. Unfortunately, the dissemination of information about the program proved otherwise and the resulting implementation of price caps on manufacturers poses a threat to innovation and the development of new vaccines.

In September 2022, a revision of cancer treatment funding took effect, including revisions to MediShield Life (MSL) and Medisave and the inclusion of cancer treatments in the Medication Assistance Fund (MAF). Cancer patients with MAF subsidies, MSL or Medisave whose treatments are on the CDL may benefit from substantial funding coverage that reduces their out-of-pocket expenses. However, cancer patients receiving treatments not on the CDL face significant out-of-pocket expenses. Excluding innovative treatments from the CDL can lead to a large portion of the population not having access to life saving treatments, including patients with private insurance.

Recently, ACE announced it would implement additional measures – in the form of international reference pricing (IRP) – to further manage the price of new medicines considered for subsidy in Singapore. IRP suffers from serious flaws as a mechanism for biopharmaceutical pricing. It assumes similarity across all countries in the reference basket and implicitly imports the pricing policies of those countries without accounting for circumstances that justify price differentiation. As these changes are considered, and with only 44 percent of new cancer medicines launched globally since 2012 available in Singapore, PhRMA member companies encourage MoH and the MSL Council to review the above-mentioned funding schemes to ensure sustainability and adequacy of coverage for patients. This can be accomplished through continued engagement with all affected stakeholders, including health care professionals, public health care institutions, patient groups and industry to ensure that the revised financing framework does not delay or restrict patient access to innovative oncology therapies, especially in the population opting for additional coverage via private insurance. The step by insurers to extend the coverage from April 2023 through September 2023 is a positive step, but still an interim measure until a more permanent solution is found.

Finally, PhRMA remains concerned that ACE’s focus seems to be strongly on price rather than health outcomes, including around the negotiations for inclusion on the CDL. The volume of information requested by the third-party vendors employed by ACE to conduct assessments, as well as their high cost and lack of transparency, is concerning. PhRMA requests that authorities provide companies with the opportunity for dialogue on the determination of medicines included in the CDL, greater transparency regarding the assumptions and rationales used during price negotiations, and a clear appeal mechanism.

Challenges in Conducting Clinical Trials

Clinical trials in Singapore can be better promoted by managing the high cost of clinical trials and accelerating the speed of setup and recruitment through standardizing clinical trial agreements/contracts across all public institutions. Industry welcomes the setup of CRIS (Consortium for Clinical Research & Innovation, Singapore), which seeks
to centralize activities to achieve operational efficiencies, scale and scalability, consistency of practices and better governance/compliance across the research platforms and programs in Singapore. Efforts coordinated by the SCRI are underway to reduce administrative complications in setting up clinical trials, including the successful launch of the Master Clinical Trials Agreement (MCTA) V2.0. PhRMA member companies are hopeful that these efforts will improve the speed and efficiency in setting up new clinical trials and urge MoH to continue to work with industry to find collaborative solutions that encourage conducting more clinical trials in Singapore.
PhRMA and its member companies have long supported closer economic ties between Taiwan and the United States, including opportunities to build on the bilateral Trade and Investment Framework Agreement (TIFA) and to contribute further to Taiwan’s health care goals. PhRMA values ongoing discussions with the Taiwan Government on health policy reform measures designed to bring stability and predictability to the pharmaceutical market and to enable patients to live longer, healthier and more productive lives; however, we are concerned that Taiwan’s drug pricing and reimbursement process does not appropriately value and reward innovation. The system also lacks transparency, due process and meaningful opportunities to provide stakeholder input in ways that are inconsistent with good regulatory practices (GRP). In this regard, PhRMA welcomed the signing of the First Agreement under the U.S.-Taiwan Initiative on 21st Century Trade on June 1, 2023. We urge USTR and other federal agencies to continue their engagement with the Taiwan Government to ensure policy changes reflect Taiwan’s GRP commitments and to establish a Medicines Working Group between the two governments that provides a regular mechanism to engage industry to advance progress on key pharmaceutical market access and IP policy issues.

Key Issues of Concern:

- **Government pricing and reimbursement barriers:** Taiwan’s pricing and reimbursement process for innovative medicines lacks transparency, due process and meaningful opportunities to provide stakeholder input, contrary to the GRP commitments included in the recently concluded First Agreement under the 21st Century Trade Initiative. In this regard, the National Health Insurance Administration’s (NHIA) renegotiation of Managed Entry Agreements (MEAs) and recent application of Health Technology Reassessments (HTRs) have created significant barriers to patient access and uncertainty for industry. In addition, under the Pharmaceutical Benefit & Reimbursement Scheme (PBRS), average prices and approval rates for new medicines continue to be low and do not appropriately recognize the value of innovative medicines. Further, the approval process is inefficient and negotiations can be lengthy, resulting in overall timelines that can exceed two years. Finally, the system fails to recognize various forms of biopharmaceutical innovation, instead focusing on cost-containment.

- **Insufficient budget for innovative medicines and indications:** Under the current structure, most new medicines and indications are either rejected or experience delays in inclusion in the formulary due to insufficient budget allocation. This challenge significantly impacts patient access to treatments for life-threatening diseases such as cancer. PhRMA urges the Taiwan Government to plan a more realistic budget for new medicines and indications in 2024 and beyond to improve patient access.

- **Drug expenditure target (DET):** PhRMA recognizes the efforts of the Ministry of Health and Welfare (MoHW) to use the DET to improve predictability for the
industry. PhRMA supports the continued piloting of DET in coordination with the industry to improve the methodologies and implementation; however, PhRMA and its members are concerned that the NHIA plans to impose international reference pricing (IRP) as a method for price adjustment under the DET. PhRMA urges the Taiwan Government to include industry early in the process of adjusting drug prices under the DET to ensure that the process adheres to principles of predictability, stability and fairness.

- **Intellectual property protection:** In July 2019, the Taiwan Food and Drug Administration (TFDA) published the final patent linkage (PL) regulation on its website and shortly thereafter the Executive Yuan announced implementation of a PL system effective August 20, 2019. While we applaud the establishment of a PL system, we are concerned that the TFDA is excluding patents that protect new doses, new dosage forms or new unit strengths. If allowed to continue, this action will seriously undermine the value of Taiwan’s PL system. PhRMA and its member companies stand ready to work with the Taiwan Government to support full implementation of the PL regulation and other reforms.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Effective Patent Enforcement**

In July 2019, the TFDA published the final patent linkage (PL) regulation and shortly thereafter the Executive Yuan approved implementation of the PL system effective August 20, 2019. While PhRMA applauds the establishment of a PL system, we are concerned that the TFDA is interpreting Taiwan’s new linkage system in a way that is unduly narrow. Specifically, the TFDA has interpreted Taiwan’s Pharmaceutical Affairs Act (PAA) to exclude patents protecting new doses, new dosage forms or new unit strengths from the linkage system. According to TFDA, drugs in these categories are not “new drugs,” and consequently, the permit holders for these drugs are not eligible to submit patent information to the PL system under Article 48-3 of the PAA. This interpretation is inconsistent with the PAA and contradicts the purpose and policy behind a linkage system, as well as the expectations by all stakeholders that the system provide an efficient means to timely resolve any patent dispute before a generic or biosimilar version of an innovative drug is launched.

PhRMA urges TFDA to acknowledge that permit holders are, and must be, eligible to submit patent listing information on patents claiming a drug’s new dosage form, new dose or new unit strength. Delisting, or not being allowed to list, the patents for a drug’s new dosage form, new dose or new unit strength provides a significant loophole to follow-on manufacturers who may seek to sidestep the PL enforcement mechanism and the protections that it provides to an innovative product by simply seeking approval of the new dosage form, new dose or new unit strength.
In the longer-term, this action would undermine the certainty that PL is designed to provide and would discourage companies from researching, developing and launching new dosage forms, new doses or unit strengths in Taiwan. It is vital to encourage this type of development because a drug’s dosage form, dose, or unit strength can have a valuable impact on its safety, effectiveness or convenience – and better serve patient needs. For example, changes to the formulation and delivery of a drug have been shown to be effective in encouraging adherence across a number of therapeutic areas. Implementing a robust PL system in Taiwan is a critical step towards ensuring that companies continue to innovate in ways that improve patient outcomes in Taiwan. We look forward to continuing to work with the Government of Taiwan to ensure full and timely implementation of the new PL system.

Market Access

Government Pricing and Reimbursement Barriers

An immediate concern of industry is the lack of transparency and due process in Taiwan’s pricing and reimbursement process, including through the renegotiation of MEAs. During the renegotiation period, the confidential pricing and rebate terms of the original agreements are not properly maintained and inclusion of new patients for the product is suspended. The renegotiation process is misused as an opportunity to unilaterally secure further price reductions. In addition, the NHIA has unfettered discretion to renegotiate the price, providing no predictability to the manufacturer at the time of termination or renewal of the MEA. Companies have no effective opportunity to raise concerns, propose alternative contractual terms or pursue an independent appeal mechanism. In addition, there is currently no standard procedure for exiting MEA renewal negotiations when consensus on terms is not reached. The lack of transparency and due process in the renegotiation of MEA has created significant barriers to patient access to innovative medicines and uncertainty for industry.

Equally concerning is NHIA’s recent application of a new HTR mechanism. Before implementing HTR, the NHIA did not provide stakeholders an opportunity to review and provide input on the mechanism. In addition, stakeholders were not given an opportunity to participate in the HTR process and express their opinions in the assessment, which is an action that lacks legal basis, due process and transparency. Citing international HTA guidelines, NHIA has unilaterally and arbitrarily expanded health technology assessments to reassessments. Separate from legal questions as to whether Taiwanese law allows for HTR, HTR should be used solely to promote patient health rather than as yet another mechanism to cut prices in Taiwan.

The MEA and HTR concerns specifically highlight the inconsistencies in Taiwan’s pricing and reimbursement process and its GRP commitments in the First Agreement under the United States-Taiwan Initiative on 21st-Century Trade. It is critical that Taiwan promptly remedies these deficiencies to promote certainty for PhRMA member companies operating in Taiwan and improve patient access to innovative medicines.
Despite constructive engagement with the National Health Insurance Administration (NHIA) regarding the PBRS, average drug prices in Taiwan continue to be low compared to median A10 countries and even by global standards.\textsuperscript{381} A key factor suppressing the prices of new medicines in Taiwan is that prices are determined based on comparator products that have experienced several rounds of annual price cuts at the time of the comparison. Moreover, under the current NHI reimbursement mechanism, the lowest price among new drugs in the same therapeutic group is used as the benchmark price for reimbursement. This mechanism fails to reflect the clinical differences among new products and does not appropriately recognize the value of innovative medicines.

Uncertainty over the prices approved by NHIA has also increased. NHIA-approved prices are often much lower than what companies had forecasted based on NHIA's pricing methodologies and re-submission and re-negotiation of prices takes considerable time. This results in overall timelines that can exceed two years, particularly for specialty medicines including in oncology. PhRMA urges NHIA to improve the transparency and predictability of its pricing processes, so that companies may bring new medicines to patients in Taiwan with reasonable certainty of their timing and reimbursement.

In summary, low reimbursement prices, and the introduction of IRP, decrease incentives to bring innovative medicines to Taiwan and to make further investments. 85 percent of new medicines launched globally since 2012 are available in the United States compared to just 38 percent in Taiwan, with Taiwanese patients waiting an average of 30 months from global first launch for the fewer medicines that become available.\textsuperscript{382} PhRMA and its member companies urge NHIA to review and revise the current pricing system to value innovative medicines more appropriately and stand ready to engage with the Taiwan Government on ways to reform the design and application of MEAs and HTRs, including through the amendment of the PBRS administrative rules.

**Insufficient Budget for New Medicines and Indications**

In March 2017, the Taiwan Government implemented a price adjustment designed to maintain spending targets that ultimately granted only compound and combination patented products some protection from price cuts, creating an unfair pricing environment for other patented medicines. In order to encourage innovation, these price protections should be available to all products during their patent term, as well as to all products during their regulatory data protection (RDP) term. As a starting point, we recommend that NHIA provide price protection to single-source products for which no alternatives are available, including products which carry no patent protection, but have been granted 5 years of RDP.

Under the current structure, most new medicines and indications are either rejected or experience delays in formulary listing due to insufficient budget allocation. This challenge significantly impacts patient access to needed treatments for life-threatening diseases, such as cancer. We urge the Taiwan Government to plan a more realistic budget for new medicines and indications to improve patient access to new medicines.

PhRMA also supports the use of horizon scanning, which is a tool to forecast future budgets through systematic information collection and analysis. Yet, PhRMA and industry are concerned that the government is developing and implementing the budget planning methodology in a non-transparent manner. As a key stakeholder in the process, industry should be allowed to provide its proposed new medicine budget planning methodology to the NHIA for consideration and should also be included in the NHIA working group for new medicine budget planning. PhRMA welcomes the opportunity to support a health care dialogue with the Taiwan Government that appropriately addresses this and other related challenges, thereby resulting in a more transparent, timely and value-based pricing and reimbursement system for innovative medicines.

**Drug Expenditure Target (DET)**

PhRMA recognizes the efforts of MoHW to use the DET to improve predictability for the industry. PhRMA supports the continued piloting of DET in coordination with the industry to improve the methodologies and implementation; however, PhRMA and its members are concerned that the NHIA plans to impose international reference pricing (IRP) as a method for price adjustment under the DET. IRP imports policies from other markets without accounting for the local conditions driving price differentials, such as differing incomes, current standards of care and regulatory requirements. The artificially low prices that often result from IRP can lead to product withdrawals and launch delays in the market implementing IRP and also undermine the availability of medicines in referenced markets.

PhRMA supports the continued piloting of DET to improve the methodologies and implementation, but urges the Taiwan Government to engage the innovative biopharmaceutical industry through regular and direct dialogue and consultations to ensure that government pharmaceutical pricing and reimbursement policies are transparent, offer due process to interested stakeholders and are based on scientific evidence and patient needs and benefits.
THAILAND

PhRMA and its member companies operating in Thailand remain concerned about significant intellectual property (IP) and market access challenges. Notably, Thailand does not provide sufficient IP protection or equitable and reasonable market access for new medicines developed and manufactured in the United States. In addition, many of the IP-related changes proposed by the Thai Government are contrary to international or regional best practices.

**Key Issues of Concern:**

- **Uncertain IP protections and enforcement:** Uncertain IP protections and lack of enforcement hinder the ability of U.S. innovators – in particular, biopharmaceutical innovators – to fairly access the Thai market. Key IP concerns in Thailand include patent backlogs and failure to provide meaningful regulatory data protection (RDP). PhRMA welcomes improvements Thailand has made to its patent system, including increasing the number of patent examiners to improve processing time for patent applications. We also welcome the proposed amendments to the Patent Act that seek to build upon this progress, such as provisions that seek to speed up the patent registration process by decreasing the period of time of requesting substantive examination from five years from the application date to three years. In light of Thailand’s significant patent delays, these improvements will be key to reducing the patent backlogs and improving efficiencies in Thailand’s patent system. While these developments make progress towards improving the registration and availability of patents in Thailand, barriers to patent ownership in the country remain an obstacle to innovation and certain provisions in the amended Patent Act threaten to undermine effective patent protection and enforcement.

- **Maximum price setting for government procurement:** The Thai Ministry of Public Health and the National Drug System Development Committee are authorized to establish a maximum procurement price (MPP) for pharmaceuticals. The MPP process, combined with Thailand’s recent preference for domestic companies, harms U.S. and other foreign innovators and further delays or prevents the introduction of new medicines. Industry stands ready to work with the Thai Government to standardize the MPP process and to ensure increased transparency and predictability.

- **Discrimination and unpredictability in government procurement policies:** The Thai Government continues to implement procurement policies that facilitate procurement privileges for the domestic Thai industry. These policies have created a discriminatory and unpredictable investment climate that creates challenges for U.S. companies seeking to compete on a level playing field in Thailand.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.
Intellectual Property Protection

Patent Backlogs, Protection and Enforcement

Although the Department of Intellectual Property (DIP) has taken some important initial steps to help clear the patent backlog – including hiring more patent examiners – patent review timelines in Thailand remain unpredictable and average 10 years after application submission. As such, we welcome the proposed amendments to the Patent Act that seek to speed up the patent registration process by decreasing the period for requesting substantive examination from five years after the application date to three years.

Long patent grant delays create uncertainty regarding investment protection and increase the risk that a third party will use a patentable invention that is the subject of a pending patent application during the pending/review periods. Indeed, at least one PhRMA member has experienced a third-party launch of a product that was the subject of a pending patent application. In that instance it took over 18 years for the patent to be granted and, even then, the member was unable to obtain meaningful enforcement of the patent. Patent term adjustments are not available in Thailand to compensate for unreasonable patent office delays, thereby reducing the effective patent term and further exacerbating the uncertainty caused by its patent grant delays.

Additionally, though some of the draft amendments to the Patent Act seek to streamline some procedures during the patent application process, other draft provisions could undermine efforts to support innovation and further exacerbate Thailand’s backlog. For example, one of the proposed amendments seeks to introduce a mechanism that would allow third parties to file challenges against a patent application up to the date of patent grant as well as to allow for pre-grant opposition after the substantive examination. These proposed opposition mechanisms would compound the existing patent backlogs and undermine the investment climate in Thailand. Other provisions, such as Section 17/1 of the Act, could impose procedural barriers by requiring applicants to disclose information regarding the use of genetic resources as part of their patent application. In some cases, compliance with such requirements is impossible, particularly where the existence or origin of any genetic resources incorporated into a product may be unknown or untraceable. Such disclosure requirements could present significant barriers to patentability and should be removed from the draft amendments.

The proposed amendments also raise concerns that patent owners will be deprived of their patents for late payment of patent maintenance fees, without sufficient notice or opportunity to make payment prior to revocation. In addition, Thailand’s restrictive application of patent eligibility criteria denies adequate protections to valuable new uses of existing pharmaceuticals.
Compulsory Licensing

Despite assurances that Thailand would be judicious in its use of compulsory licenses (CLs) and consult with affected parties as required by the World Trade Organization (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS), Thailand continues to improperly facilitate the use of CLs. Thailand’s compulsory licensing regime lacks sufficient due process and dialogue with affected companies and suffers from a lack of transparency in the reasoning behind CL decisions. DIP’s proposed amendments to the Patent Act to add provisions on compulsory licensing raise concerns that Thailand may be seeking to increase its use of compulsory licensing in the future. Even the mere potential that Thailand may use compulsory licensing in the future brings into question the predictability and enforceability of patents in Thailand. Such doubts undermine incentives for development of new medicines and innovative treatments, thereby threatening to slow the introduction of new medicines in Thailand and decrease access to medicine for Thai patients. If DIP moves forward with amendments to its compulsory licensing regime, it should do so in a manner that adopts international best practice and adheres to Thailand’s international treaty obligations under Articles 31 and 31bis of the TRIPS Agreement.

PhRMA believes governments should grant CLs in accordance with international rules and only in exceptional circumstances and as a last resort. Decisions should be made through fair and transparent processes that involve participation by all stakeholders and consider all relevant facts and options.

Regulatory Data Protection Failures

Ministerial regulations issued by the TFDA regarding the Trade Secrets Act of 2002 do not provide RDP that would prevent generic or biosimilar drug applicants, for a fixed period of time, from relying on the innovator’s regulatory data to gain approval for their versions of the innovator’s product. The Act aims only to protect against the “physical disclosure” of confidential information.

PhRMA’s member companies strongly encourage the Royal Thai Government to institute meaningful RDP. Specifically, Thailand should: (1) implement new regulations that do not permit generic or biosimilars producers to rely directly or indirectly on the originators’ data, unless consent has been provided by the originator, for the approval of generic or biosimilar pharmaceutical products during the designated period of protection; (2) bring the country’s regulations in line with international standards by making clear that data protection is provided to test or other data submitted by an innovator to obtain marketing approval; (3) provide protection to new indications; and (4) require TFDA officials to protect information provided by the originator by ensuring it is not improperly made public or relied upon by a subsequent producer of a generic or biosimilar pharmaceutical product.
Market Access

Maximum Price Setting for Government Procurement

The MPP process, combined with Thailand’s recent preference for domestic companies, harms U.S. and other foreign innovators and further delays or prevents the introduction of new medicines. Currently, only 24 percent of new medicines launched globally since 2012 are available in Thailand, with patients in Thailand waiting an average of 38 months after global first launch for the fewer medicines that become available.383 Fortunately, the Public Procurement Act introduced in August 2017 mandates the creation of a Reference Price Subcommittee for Pharmaceutical and Medical Supplies, which would be responsible for handling reference price issues and standardizing the process. The innovative biopharmaceutical industry seeks the expedited formation of this subcommittee, as well as the inclusion of members from the private sector so that all stakeholders may collaborate on appropriate policies that address the fiscal concerns of the Thai Government in the procurement of pharmaceuticals, as well as the concerns of innovators and the needs of Thai patients. As part of improving the pricing and reimbursement process, PhRMA and its member companies encourage the Thai Government to explore innovative pricing and reimbursement schemes that improve therapeutic outcomes and clinical needs of patients. Further, while industry welcomed the Thai Government’s issuance of an annual plan related to the MPP process, additional relevant details are needed to increase transparency and predictability.

Preferential Procurement of Domestic Innovation

In 2016, the Thai Government established the Thai Innovation List and the Made in Thailand initiatives to develop domestic industrial capacity in several innovation sectors, including pharmaceuticals. Only Thai majority-owned companies qualify to be listed. Once listed, Thai companies receive special government procurement privileges, including an earmark for at least 30 percent of orders by Thai Government agencies. Paradoxically, it appears that to qualify as a pharmaceutical innovator and be eligible for inclusion on the list, the Thai company needs only to demonstrate that their generic copy is bioequivalent to the originator product. As such, the so-called Thai Innovation List exists solely to favor local generic companies to the exclusion of U.S. and other foreign research-based biopharmaceutical companies.

The Innovation List was created under the Thailand 4.0 policy to incentivize innovation development. However, by excluding international companies, it deters international collaborative investment to promote innovation in Thailand. A more inclusive criteria that values research investment and embraces the creation of innovation without a nationality focus would foster a more investment-friendly environment.

Preferential Procurement Privileges for the Government Pharmaceutical Organization (GPO)

The GPO, a Thai State-owned enterprise that manufactures pharmaceutical products in Thailand, benefits from preferential procurement privileges. Per Ministerial Regulation B.E.2560 (2017), government hospitals must procure at least 60 percent of their medicines budget from the National List of Essential Medicines (NLEM). Specific procurement methods are required if the product on the NLEM is manufactured by the GPO or the Thai Red Cross Society. Purchases from other suppliers are permitted only when the GPO or the Thai Red Cross Society is unable to produce and distribute the product. In addition to these procurement preferences, under the Drug Act B.E. 2510 (1967), the GPO is not required to obtain FDA approval prior to launching medicines on the Thai market. There is no such exemption for private sector manufacturers or sellers, all of whom must obtain appropriately market authorization from the Thai FDA prior to selling their products in the Thai market. Further procurement privileges are also being extended to local vaccine producers under National Vaccine Committee Regulations on “Vaccine Procurement in Government Sector” that went into effect on August 14, 2020.

Inconsistent and Nontransparent Oncology Preauthorization System (OCPA)

The OCPA was established in 2006 as a direct reimbursement system to hospitals for “high-cost cancer drugs” administered to patients under the Civil Servants Medical Benefit Scheme (CSMBS). The system was intended to reduce out-of-pocket disbursements for its beneficiaries and to ensure rational use of certain innovative cancer medicines by identifying those products for which government hospitals would be directly reimbursed through prior authorization and approval based upon a pre-defined protocol of individual cancer medicines. Unfortunately, the process and criteria involved in the OCPA lack predictability and are applied inconsistently between different companies and different products. Further, recent revisions to the OCPA will result in certain innovator products being deemed not eligible for “direct reimbursement” based on unclear selection criteria or “non-reimbursable” if newly approved.

Specifically, while many innovative medicines, including cancer medicines, had been directly reimbursable by the CSMBS immediately upon being granted marketing authorization, revisions to OCPA procedures in February 2018 structured reimbursements on a tiering system: Group 1 (OCPA) or Group 2 (certain innovative and non-OCPA) products continue to be directly reimbursable, Group 3 (other innovative and non-OCPA) products require patients to provide advance payment for their medicines with no guarantee of reimbursement and then apply for government reimbursement and Group 4 (newly-approved) products are non-reimbursable and fully paid by the patient. These revisions, which were due to government budget constraints, will create access barriers to patients who cannot pay out-of-pocket for medicines and will limit provider and patient choice. For example, only one medicine per indication will be allowed in Group 1, meaning that patients treated by other medicines will be forced to pay out-of-pocket or switch treatments. Moreover, the criteria for how products are placed into each group are unclear and potentially are based on which products have the lowest procurement price.
To ensure patient access to innovative medicines and to respect physician determinations regarding the most appropriate treatment for a given patient, the government should establish transparent procedures and criteria for OCPA reimbursement evaluation, with consideration to clinical outcomes and needs rather than pure cost-containment. In addition, Thailand should provide greater flexibility to allow for negotiation of alternative financial models with manufacturers so that patients have better access to new medicines and the government is afforded greater certainty over health care spending. PhRMA members urge the Thai Government to engage with a range of stakeholders, including industry, to optimize the OCPA procedures and thereby improve patient access to innovative therapies.
TURKEY

PhRMA and its member companies operating in Turkey face several market access and intellectual property (IP) challenges due to forced localization measures, arbitrary pricing and reimbursement policies, unpredictable registration timelines, weak patent enforcement and regulatory data protection (RDP) failures. The use of an artificially low Euro/Turkish Lira exchange rate for the sole purpose of regulating medicine prices, as well as frequent deviations from the pricing regulations in effect, also creates an unviable business environment and threatens patient access to new medicines. Over the past decade, Turkey has undertaken reforms to modernize its economy and expand health care for Turkish patients. However, a lack of transparency and predictability in government decision-making has contributed to policies that undermine Turkey's investment climate and damage market access for PhRMA member companies.

Key Issues of Concern:

- **Arbitrary pricing policies:** The Turkish Government continues to set an insufficient budget for medicines that disregards exchange rate fluctuations and patient needs. Turkey regulates pharmaceutical prices using international and therapeutic reference pricing and a fixed exchange rate instead of a market-based exchange rate to convert the value of the Euro into local currency. Although Turkish regulations had specified that the exchange rate would be updated at the beginning of each year to reflect 70 percent of the average exchange rate the preceding year, the Turkish Government changed the regulation a day before implementation to 60 percent of the average exchange rate in 2019. Such discretionary actions create significant uncertainty in the Turkish market. The practice of using an artificially low exchange rate, which is applied only to the biopharmaceutical sector, coupled with Turkey’s currency fluctuations and inflation (the annual inflation rate was 72 percent in 2022), threaten both supply continuity and the sustainability of the industry.

- **Local inspection requirements and delays:** PhRMA and its member companies welcome efforts by the Turkish Drug and Medical Device Agency (TITCK) to improve the regulatory approval procedures of highly innovative and/or life-saving products with limited therapeutic alternatives in Turkey. Specifically, prioritizing Good Manufacturing Practices (GMP) audit procedures and allowing a parallel marketing application process decreased delays in approving these products. However, while products deemed highly innovative are receiving preferential reviews, products without this designation face increased delays due to the lack of resources and efficient procedures for GMP inspections. PhRMA and its member companies commend Turkey for becoming a PIC/S (Pharmaceutical Inspection Convention and Co-operation Scheme) member to better align its GMP inspections with other members of the scheme. However, GMP inspection delays continue to add to registration delays, hindering patient access to innovative medicines and negating the benefits of the patent and data protection periods for many products. In addition, the Ministry of Health (MoH) required companies to
submit a price commitment and two-year budget analysis as part of the GMP and registration prioritization submission, inappropriately linking pricing and reimbursement to the separate science-based determination of whether a new medicine (and the manufacturing facility) is safe and effective. As it stands, there is currently no process for seeking prioritization of registrations and TITCK recently published a revised GMP Prioritization Guideline where price and budget impact requirements were removed from the prioritization assessment criteria. Nonetheless, industry continues to monitor the situation closely to ensure that these inappropriate requirements are not reintroduced.

- **Weak patent enforcement and regulatory data protection failures:** While innovation and regulatory test data have received IP protection in Turkey since 1995 and 2005, respectively, significant improvements are still needed. For instance, while Turkey’s Industrial Property Law, which was passed by the Turkish Parliament in 2016, better aligns Turkey with the European Patent Convention, certain provisions in the new law inappropriately expand the possibility of granting compulsory licenses (CLs) in Turkey. In addition, Turkey does not provide an effective mechanism for resolving patent disputes before the marketing of follow-on products. Further, Turkey inappropriately ties the RDP period to the patent term and the lack of RDP for combination products is still an unresolved issue. Critically, the RDP term begins with first marketing authorization of the original product in any of the EU-Turkey Customs Union Area Member States and thus, as a result of significant regulatory approval delays in Turkey, the effective RDP term is reduced significantly. Consistent with Turkey’s international obligations, the RDP term should begin when a product receives marketing authorization in Turkey.

- **Forced localization measures:** Following implementation of the 10th Development Program and provisions in Article 46 of the 64th Government Action Plan released in December 2015, the Turkish Government initiated a forced localization program which called for delisting imported products from the Social Security Institution (SSI) reimbursement list if they are not produced locally and provide preferential reimbursement for domestic products. In April 2019, the European Union (EU) launched a World Trade Organization (WTO) dispute against these forced localization measures, halting further waves of product delistings. In April 2022, the WTO Panel ruled in favor of the EU, a decision that was affirmed on July 25, 2022, through arbitration under Article 25 of the WTO Dispute Settlement Understanding (DSU). Since then Turkey has taken a

---

number of actions to implement these decisions.\textsuperscript{386} PhRMA will continue to monitor Turkey’s response accordingly.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

\textbf{Intellectual Property Protection}

\textbf{Weak Patent Enforcement}

In January 2017, Turkey enacted a new Industrial Property Law (No. 6769) that addresses IP, including patents. While the specialized IP courts have improved IP enforcement options in Turkey, IP Court judges lack relevant, and notably technical, training and capacity to effectively resolve patent disputes. Consequently, the quality of IP trials remains insufficient, all the more as the Court of Appeals case law requires that all patent validity cases are referred to court-appointed expert panels, which often consist of a single patent attorney and lecturers from universities. Despite the new law on court appointed experts, the expert examination system also lacks appropriate procedural safeguards. While relevant case law provides that the IP Court judge can deviate from the expert panel’s opinion where he or she provides a reasoned opinion to the contrary, in practice, decisions in the majority of cases mirror the opinions of the panel.

\textbf{Compulsory Licensing}

In addition, PhRMA and our member companies are concerned about the CL provisions of Industrial Property Law No. 6769. That law inappropriately expands the discretion to consider CLs in cases of non-use of the patent and in cases where a third-party claims that domestic demands are not being met. The vagueness of that provision creates significant uncertainty for patent holders and may be abused by competitor third parties. PhRMA believes governments should grant CLs in accordance with international rules and only in exceptional circumstances and as a last resort. Decisions should be made on public health grounds through fair and transparent processes that involve participation by all stakeholders and consider all relevant facts and options.

In December 2021, TITCK published the updated “Regulation on the Registration of Medicinal Products for Human Use” (Registration Regulation). While the Registration Regulation includes a provision on compulsory licensing, the regulation does not clarify essential substantive and procedural requirements.

Regulatory Data Protection Failures

In 2005, the Turkish Government took positive steps toward establishing protection for the commercially valuable regulatory data generated by innovative pharmaceutical companies and now provides RDP for a period of six years for products starting from the first MA registration in any of the EU-Turkey Customs Union Member States. Several aspects of this regime are however of significant concern for the innovative pharmaceutical industry.

The period of RDP currently begins on the earliest marketing authorization in any country of the EU-Turkey Customs Union. Considering the extended regulatory approval times and delays stemming from the GMP certification approval period current estimates are that it could take one to three years, and longer in some cases, to register a new medicine in Turkey, i.e., long after approval in the EU. Under these adverse circumstances, new products receive, in practice, no more than one to two years of RDP in Turkey, undermining incentives needed for innovators to undertake risky and expensive research and testing.

In addition, if a product is patented in Turkey, RDP ends when that patent expires, even if this is prior to the end of the six-year RDP term. RDP is a form of protection that serves a different purpose than patent protection and is independent and separate from patent protection. Therefore, it should not be limited to the period of patent protection.

RDP in Turkey is further undermined by the Regulation to Amend the Registration Regulation of Medicinal Products for Human Use. This Regulation, contrary to EU standards, does not provide RDP for combination products, unless the combination product introduces a new indication. Innovative companies invest considerable amounts of time and effort to develop products that provide increased efficacy and safety for the benefit of patients, as well as new indications, from new combinations of separate molecules.

Market Access

Arbitrary Pricing Policies

In Turkey, pharmaceutical pricing is regulated by TITCK under the Decree for Pricing of Medicinal Products for Human Use, which sets prices at a discount below the lowest price in a basket of five European countries (France, Portugal, Spain, Italy and Greece) and the country of origin and the country of batch release. In addition, TITCK uses a fixed exchange rate instead of a market-based exchange rate to convert the value of the Euro into local currency. Over the last few years, TITCK has begun to annually adjust the fixed Euro/Turkish Lira exchange rate used to set prices under the Decree. However, per this Decree, the fixed exchange rate is currently set at 60 percent of the preceding year’s actual exchange rate, automatically building in further discounts for the Turkish Government. To exacerbate the problem, Turkey has moved the goal posts over the past two years, with the percentage coefficient not being met in 2018 and then being
lowered from 70 percent to 60 percent in 2019. While the exchange rate was updated in February 2020 based on the new 60 percent, the percentage coefficient was not met in 2021, 2022 nor in 2023, despite semi-annual adjustments in both 2022 and 2023. Biopharmaceutical companies continue to be confronted with uncertainty of the likelihood and parameters of the update year after year.

Industry remains concerned that the situation has become unsustainable and that without significant reform, there will be further deterioration in patient access to new medicines. Over the past five years, patient access to new medicines has significantly worsened in Turkey. Five years ago, 30 percent of new medicines launched globally over the prior ten years were available; today, only 22 percent of new medicines launched globally over the prior ten years are available in Turkey.387

By definition, Turkey’s arbitrary fixed exchange rate discriminates not only against pharmaceuticals – the only sector subject to this fixed exchange rate – but also against imported pharmaceuticals contrary to Turkey’s national treatment obligations. Whereas prices for imported products are determined based on the fixed exchange rate, domestic manufacturers of innovative products that are only available in Turkey and for which there is no international reference product available would be permitted to negotiate prices directly with the MoH based on clinical and economic evidence. The practice also appears inconsistent with Article II:3 of the Bilateral Investment Treaty (BIT) between U.S. and Turkey, which requires that investments “shall at all times be accorded fair and equitable treatment and shall enjoy full protection and security in a manner consistent with international law.” Failure to update the exchange rate to reflect the actual exchange rate at the time of calculation has continued to undermine the U.S. biopharmaceutical industry’s “legitimate expectations” as to the how prices would be calculated. It is also “tantamount to expropriation,” in that it substantially deprives the U.S. pharmaceutical industry of the reasonably-to-be-expected economic benefits of its investments in Turkey to the obvious benefit of the Turkish Government, contrary to Article III:1 of the U.S.-Turkey BIT.

Nontransparent Reimbursement Policies

The public reimbursement system is based on a positive list and reimbursement decisions are made by the inter-ministerial Reimbursement Commissions, led by the SSI under the Ministry of Labor and Social Security (MoLSS). The reimbursement decision process lacks transparency and is not subject to clearly defined decision criteria. Further, the process is not based on pre-defined evaluation criteria, does not require the publication of an official medical evaluation report to support the assessment and does not consider the perspectives of patients, physicians and other relevant stakeholders. Companies requesting reimbursement are required to submit a cost-effectiveness analysis, but the assessment of these submissions is opaque. On the rare occasion that a company receives a formal written decision, it is a simple one-page document stating acceptance or rejection, without any explanation of the grounds upon which the decision

was made. Finally, companies are expected to offer additional price concessions and rebates through poorly defined managed entry agreements that have delayed patient access to new medicines.

The insufficient budget allocated to the health care system, especially for medicines, fuels the problems described above and remains a major concern for PhRMA member companies. Compared to other OECD countries, of which Turkey is a member, the Turkish Government’s budget does not support an innovative health care ecosystem and patient needs. In turn, Turkey’s spending on medicines is below one percent of GDP, among the lowest in the OECD.

Forced Localization Measures

In 2018, the Turkish Government began implementing policies to delist imported products from the reimbursement list. With just 22 percent of new medicines launched globally since 2012 available in Turkey, the vast majority of all medicines sold in Turkey are distributed through the SSI reimbursement list and exclusion from this list effectively bars market access for these products.

As part of the first wave of delisting notices, which impacted 71 products with additional products in 2018, PhRMA member companies began receiving notices in February 2017 that their products would be delisted within 12 months unless they submitted plans to “localize” these products in Turkey. The second wave of delisting notifications was announced in May 2017 and affected 176 products, of which 119 products were delisted as of July 2018 with an eventual 185 products delisted over 2018 and 2019. Further rounds of delistings were halted when the European Union initiated a WTO dispute in 2019 against the localization measures on the basis that they were inconsistent with Turkey’s national treatment obligations under several WTO agreements.

Ahead of the WTO Panel issuing its decision which ruled in favor of the EU, the Parties agreed to arbitration under Article 25 of the WTO DSU. Per that process, the Panel Report was included in Turkey’s Notice of Appeal. The Arbitration Award issued on July 25, 2022, affirmed the findings of the Panel that Turkey’s localization requirement was inconsistent with the national treatment obligation in Article III:4 of the GATT 1994. In so finding, the Panel rejected Turkey’s arguments that the measures were exempt either under the “government procurement” derogation in Article III:8(a) of the GATT 1994 or under the general exemption for measures necessary to protect human life and health under Article XX(b) of the GATT 1994. Since then Turkey has taken a number of actions

---

388 See, e.g., Article 46 of the 64th Government Immediate Action Plan.
to implement these decisions. PhRMA will continue to monitor Turkey’s response accordingly.

**Biopharmaceutical Product Registration**

Although efforts have been taken to improve the regulatory process, an AIFD survey from June 2020 through December 2021 indicates that the median regulatory approval period is 695 days for high priority products, 949 days for prioritized products and 1,176 days for normal priority products. TITCK amended their previous method for regulatory procedures and is now required to assess and authorize the registration of all medicinal products, regardless of prioritization, within 210 days; however, without additional resources to complete product registrations, delays will continue.

It is estimated that approximately 1,704 registration dossiers are pending due to a number of operational delays. TITCK has committed to work on solutions, but progress has been limited to date. TITCK implemented additional measures such as increasing the number of employees and announcing new guidelines. Accelerated and flexible regulatory pathways (reliance, verification, mutual recognition, etc.) are needed to reduce the backlog and ensure that Turkish patients have timely access to needed medicines. Promisingly, TITCK has shown receptivity on allowing for greater regulatory reliance, including for registrations (Regulation on the Amendment of the "Regulation on the Authorization of Medicinal Products for Human Use", announced on September, 25, 2022 and recently updated on 26th August, 2023), variations (“Regulation on Variations in Registered Medicinal Products for Human Use” announced on December 18, 2021), and in guidelines related to GMP evaluations, analysis, pharmacovigilance activities and clinical trials, and registrations. TITCK also launched a pilot project regarding electronic submissions of clinical trial data.

**Local Inspection Requirements and Delays**

The MoH’s revisions to the Registration Regulation have compounded the country’s registration delays. Effective March 1, 2010, a GMP certificate that is issued by the Turkish MoH must be submitted with each application to register a medicinal product for each of the facilities at which the product is manufactured. The GMP certificate can only be issued by the MoH following an on-site inspection by Ministry inspectors, or by the competent authority of a country that recognizes the GMP certificates issued by the Turkish MoH.

---

392 Regulation to Amend the Registration Regulation of Medicinal Products for Human Use, Official Gazette No. 27208 (Apr. 22, 2009) (Amended Registration Regulation); MoH, “Important Announcement Regarding GMP Certificates,” Dec. 31, 2009 (establishing an implementation date for the GMP certification requirement).
On a positive note, the TITCK’s 2018-2022 Strategic Plan stipulates that the Agency is responsible for accelerating the GMP inspection and certification processes of priority medicines which are needed on the market within one year. However, the absence of strategic performance indicators for products prioritized by TITCK may give rise to uncertainty in the GMP inspection processes of these products.

Furthermore, although the Amended Registration Regulation permits applicants to submit GMP certificates issued by competent authorities in other countries, it does so only to the extent that the pertinent country recognizes the GMP certificates issued by Turkey. While PhRMA commends Turkey for joining PIC/S in January 2018, this is but the first of many steps that will be required before Turkey could enter into mutual recognition agreements with the United States and other trading partners. Until mutual recognition agreements are in place, Turkey, at a minimum, should allow for parallel processing of the GMP review and the review of the registration submission.

In response to the COVID-19 pandemic, TITCK exercised further flexibility regarding GMP submissions and GMP Certification dates. On June 2020, TITCK announced Supplementary Measures to be Applied During the Pandemic regarding GMP Inspections and Certifications including an extension for validity of certificates and acceptance of file-based inspection submissions for high priority products. Over the last couple years, file-based inspections were carried out with an inspection period of 202 days. As of December 2021, file-based inspection submissions have been expanded to priority products and the number of inspectors is planned to increase through 2023. Meanwhile, the validity period of GMP certificates has been extended until the end of June 2024.

Financial Impact Projection Request in GMP and Registration Prioritization Applications

TITCK requested price commitments and a “two-year financial impact projection” in their assessment process for “prioritization of good manufacturing practices (GMP)” and “prioritization of registration” applications for innovative products. In June 2023, TITCK revised its Prioritization Guideline to remove this budget impact requirement. This change is a positive sign for biopharmaceutical companies in Turkey, as prioritization of GMP inspections should be based on a clinical and technical evaluation of the scientific data, not the proposed price of the drug or its price in other markets (particularly when prices in other countries may not yet be available or indicative of the actual price/appropriate price in Turkey).

Orphan Drug Guidelines

Since 2009, the MoH has been developing a pathway for orphan medicines in Turkey. Although there have been some successful workshops to progress the issue, there remains no published pathway. In August 2015, the Ministry of Industry and Technology (MoIT) published an in-depth analysis of the impact of rare diseases on Turkey’s population in its “Pharmaceutical Sector Strategy and Action Plan of 2015.” This study called for the creation of a national orphan drug policy. To this end, the MoH is
currently working on a “Rare Diseases Health Strategy Document.” The innovative pharmaceutical industry looks forward to working with key stakeholders, including the MoH, SSI, MoIT, Ministry of Trade, Ministry of Industry & Technology, Ministry of Treasury and Finance and civil society organizations, to establish a market access pathway and appropriate incentives to facilitate the development and commercialization of medicines to treat rare diseases and thereby better ensure that Turkish citizens have access to the medicines they need. As part of this process, it will be critical for Turkey to define rare diseases and orphan drugs based on international best practices, including current EU prevalence standards. As a positive development, a Rare Diseases Health Strategy Document and Action Plan was launched by the MoH in November 2022.
UNITED ARAB EMIRATES

The United Arab Emirates (UAE) has made great progress in recent years to provide an increasingly competitive environment for operating and investing in the life sciences and innovative biopharmaceutical sector. This effort has resulted in attracting the regional headquarters for many international companies, increased investment in clinical research and expanding regional logistics, warehousing and manufacturing operations. Nonetheless, questions remain regarding the provision of intellectual property (IP) protections and enforcement in the UAE. Industry looks forward to continuing its constructive engagement with the UAE Government to ensure that recent IP measures are consistent with the UAE’s international commitments and implemented in a manner that provides effective and meaningful patent protection and regulatory data protection (RDP) for all innovative pharmaceuticals.

**Key Issues of Concern:**

- **Effective patent enforcement and regulatory data protection:** The UAE has not historically offered an adequate IP framework to ensure that patents are appropriately protected and enforced, and generic and biosimilar manufacturers cannot prematurely rely on the confidential information that innovators must submit to regulatory authorities to demonstrate the safety and efficacy of a medicine for marketing approval. Promisingly, on September 21, 2020, the UAE released Decree 321, which has the potential to address these deficiencies. In mid-2021, however, the UAE released a new IP law (Law No. (11) of 2021) that appeared to create a conflict with the protections promised in Decree 321 and would allow for compulsory licenses (CLs) to be issued on broad and vague grounds. Industry seeks to continue its constructive engagement with both the UAE and U.S. Governments to ensure that the Decree 321 is implemented consistently with international obligations and in a manner that provides effective and meaningful patent protection.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

**Effective Patent Enforcement and Regulatory Data Protection**

The UAE issued Decree 321 on September 21, 2020. This highly promising decree provides eight years of RDP and anticipates the implementation of new systems in the UAE to ensure the effective enforcement of patents on innovative pharmaceutical products (including the enforcement of Decree 404 for innovative products approved prior to Decree 321 being published in the official gazette). PhRMA and its members look forward to continuing our constructive engagement with the UAE Government to ensure that the Decree (and in particular the proposed exceptions in Article 5) are consistent with the UAE’s international commitments and that it is implemented in a manner that provides...
effective and meaningful patent protection and RDP for all innovative pharmaceuticals (including biologics).

More broadly, industry also welcomed the UAE’s efforts to update its IP regime through the release of a new Industrial Property Rights Law (Law No. (11) of 2021). While many of the core IP provisions are consistent with international best practices, the final legislation raised a number of concerns. For example:

- It includes overly broad and vague grounds for issuing CLs in the UAE (i.e., whenever it is deemed that the patent is being “insufficiently utilized” in the UAE (Article 25)). CLs should only be granted in accordance with international rules and only in exceptional circumstances and as a last resort.

- It contains RDP provisions that are inconsistent with those provided by Decree 321 (referencing only five years of RDP measured from the date of seeking marketing approval (Article 62.2) versus the eight years of protection from the date of marketing approval provided by Decree 321).

- Article 22 exempts from patent protection “the combination of two or more medicines for the purpose of medical treatment by a licensed pharmacist.” That article has created significant ambiguity on the patentability and enforceability of medical use patents.

The UAE Government has issued strong statements highlighting that the Industrial Property Rights Law will be implemented in a manner consistent with Decree 321 and the UAE’s broader international commitments. As such, industry looks forward to working with both governments to ensure that this interpretation is formalized under UAE law and recognized in practice.
UNITED KINGDOM

PhRMA and its member companies operating in the United Kingdom continue to work with the UK Government, the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium, the All Wales Medicines Strategy Group, NHS England, as well as other National Health Service (NHS) partners to support implementation of policies that strengthen the innovative pharmaceutical industry and address long-standing market access and pricing issues. Of particular concern are the continued challenges around patient access and adoption and uptake of innovative medicines, challenges with the protection of intellectual property (IP) and UK regulatory capacity post-Brexit, and the need for continued support for the government’s life sciences strategy.

Key Issues of Concern:

- **Rapidly escalating clawback payments on innovative medicines**: The Voluntary Scheme for Branded Medicines Pricing and Access (VPAS) has resulted in rapidly escalating clawback payments that in effect tax company revenue far higher than for any other industry. Biopharmaceutical companies must choose between this “Voluntary Scheme” and a statutory scheme with similar clawback payments; as such, the UK Government has ensured that this clawback is mandatory. Over 2019-20, under the voluntary scheme, companies paid around 5 percent of their net sales back to the UK Government. The rate tripled to 15 percent in 2022 and has been set at 26.5 percent for 2023. This has resulted in biopharmaceutical companies paying back over £5bn to the UK Government during the past two years (2022-2023) – more than two and a half times the amount paid during the prior three years (2019-2021) – and the exit of major biopharmaceutical companies from the VPAS. The clawback payments on brand revenue growth demanded by the UK voluntary and statutory schemes are well beyond that of any comparable country. This is despite NHS prices paid for medicines being amongst the lowest in the developed world. The deteriorating situation risks the United Kingdom’s status as a destination for life sciences investment. Discussions between industry and the UK Government on determining clawback payments under VPAS during the next five-year period are well underway, with the aim of securing an agreement by year end. Companies are seeking to achieve relief on the 2023 payment rate and an internationally competitive, sustainable and predictable scheme for 2024 onwards that supports the growth agenda and the mission of the UK Life Sciences Vision.

- **Longstanding restrictions on the valuation of innovative medicines and patient access**: Rigid health technology assessment (HTA) methods that require

---

increasing discounts to meet low thresholds for cost-effectiveness – combined with overlapping cost containment measures across the health care system designed to limit the pharmaceutical share of health spending below that of most developed markets\(^{395}\) – remain challenging for biopharmaceutical innovators and inhibit the ability of UK patients to access the full range of licensed indications for the latest innovative medicines. NHS patients often cannot access new treatments with proven added clinical benefit. Despite multiple initiatives, progress on improving uptake has been limited and full patient access to some of the newest medicines remains slow and variable across the health system compared to peer countries. More comprehensive reforms than one-off commercial agreements are needed to ensure wider availability and uptake of innovative medicines.

- **Continued need to deliver on ambitions for the life sciences sector:** When the governing Conservative Party was elected in 2019, it ran on an ambitious platform with the goal to make the United Kingdom a leading hub for life sciences. The sector forms a key pillar of the UK’s economy and this is recognized by the UK Government. In July 2021, the UK Government published the *Life Sciences Vision*, setting out its industrial policy on the sector. The *Vision* is an evolution of the 2017 Life Sciences Industrial Strategy and was developed in partnership with industry and the wider life sciences sector. The recognition of the contribution of the life sciences sector to the health and wealth of the nation is welcome and timely, as is the recognition of the integral role that the NHS plays in contributing to innovation from concept to delivery. PhRMA encourages the UK Government to continue to work with industry to fund and implement the *Life Sciences Vision*, including through improvements to the R&D landscape as well as meaningful reforms to the UK commercial environment, and also to ensure that the NHS is an engaged partner in the UK life sciences ecosystem.

- **Evolution of the UK’s intellectual property framework post-Brexit:** The UK’s exit from the European Union (EU) provides an opportunity to maintain strong IP protections and further drive robust innovation policies, including effective periods of regulatory data protection and supplementary protection to restore a portion of the time lost during the marketing approval process. U.S.-UK trade negotiations provide an opportunity for the United Kingdom to affirm high IP standards. Through its independent trade negotiations, the United Kingdom should continue to push for strengthening IP frameworks and look to set precedent where possible. This will support the global pharmaceutical industry, at a time when IP frameworks look to be weakened globally. However, some of the proposals in the recent Statutory Scheme consultation would threaten the existing IP framework.

- **Maintenance of the Medicines and Healthcare products Regulatory Agency (MHRA) as a world-leading health regulatory body:** The United Kingdom should ensure the MHRA is sufficiently funded and resourced to enable it to operate effectively. The United Kingdom should focus on developing a regulatory system

\(^{395}\) *Id.*
for medicines that is innovative, agile and globally relevant. Furthermore, MHRA should continue to explore collaborations with regulators around the world to shape policy, boost UK trade and influence emerging areas of technology.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved.

**Intellectual Property Protection**

Effective IP protection and enforcement is essential to develop new medicines for patients who need them. Subsequent to the United Kingdom exiting the European Union, it is important that the United Kingdom maintain robust IP protections. In addition, the United Kingdom should seek to distinguish its innovation environment for the life sciences from the European Union by enhancing incentives where the European Union has unfortunately weakened its innovation framework. For example, the United Kingdom should eliminate the EU “SPC waiver” that undermines life sciences innovation by exempting from infringement manufacturing of inventions during the SPC term.

Brexit does not change the UK’s membership under the European Patent Convention (EPC) and any patent granted under the EPC can still be validated and enforced in the United Kingdom after Brexit. Following the end of the post-Brexit transition period, it is critical that the United Kingdom revise its legislation to calculate the duration of SPCs from the date of UK marketing authorization (rather than the earliest date of authorization in the European Union/European Economic Area or United Kingdom, as now). Continuing to make the duration of IP protection offered in the United Kingdom potentially still dependent on the acts of EU authorities is illogical, now that the UK and EU medicines regulatory systems are operating independently of each other, and consequently may erode the effective protection period in the United Kingdom. Despite industry having raised these specific concerns strongly with the UK Government, these issues remain unresolved.

As the UK Government considers future free trade agreements post-Brexit, including with the United States, USTR should ensure that the United Kingdom affirms its commitment to strong IP protections. In particular, it should enshrine the provision of stable RDP and continue to ensure that orphan and pediatric exclusivities that meet the highest international standards remain in place (at a time when some in the European Union are seeking to undermine those incentives).

**Market Access**

**Government Restrictions on the Valuation of Innovative Medicines and Patient Access**

New medicines in the United Kingdom can be launched upon regulatory approval, potentially making it one of the world’s fastest countries for market access. However, in practice, despite the introduction of the Early Access to Medicines Scheme (EAMS), Project Orbis and the Innovative Licensing and Access Pathway, UK patients
experience delays in being treated with new medicines due to barriers in the market access pathway, including a lack of funding after marketing authorization is granted. Only 48 percent of new medicines launched globally since 2012 are publicly funded for patients in NHS England, compared to 85 percent in the United States, and patients in NHS England experience far more restrictions when attempting to access the new medicines that are funded. Only 34 percent of the new medicines that NICE recommends are funded for their full market authorization and all approved indications. In addition, NHS England patients wait an average of 27 months from global first launch to public funding.\(^{396}\)

A key reason why UK patients experience reduced access to new medicines is the high rate of “positive” recommendations by NICE that restrict the patient populations who can access those medicines compared to their market authorizations; more than 60 percent of new medicines with “positive” NICE recommendations have such restrictions.\(^{397}\) When making recommendations, NICE assesses medicines using a baseline cost-effectiveness threshold of between £20,000 and £30,000 per quality-adjusted life year (QALY), adjusted by a severity weighting. This baseline threshold has not been revised – even in line with inflation – since NICE’s inception in 1999, which means that the threshold has declined in real terms by about 45 percent over the past two decades.\(^{398}\) Innovative medicines exceeding a cost per QALY threshold of £30,000 (or £100,000 to £300,000 for a very small number of highly specialized technologies) are generally viewed as not cost-effective, which can leave patients without access to clinically superior products. In addition, as companies develop new therapeutic advances, often in areas where there are many older off-patent medicines that are much lower in cost, demonstration of cost-effectiveness becomes exceedingly difficult.

Moreover, NICE has often been criticized for being inflexible in evaluating new medicines for which there is greater uncertainty about data (e.g., due to the immaturity of data or single-arm trials), which disproportionately impacts patient access to treatments for small patient populations (e.g., rare conditions) or for subsets of populations (e.g., targeted therapies). NICE has made some changes to its Manual for health technology evaluations, which industry hopes will support a more pragmatic and flexible approach, but many areas of concern remain. The now well-established use of managed access agreements to support conditional approval for cancer medicines via the Cancer Drugs Fund (CDF) has now been extended to cover non-cancer medicines via a new Innovative Medicines Fund (IMF), which further acknowledges the need for greater flexibility and solutions to managing high levels of uncertainty. However, after more than a year since its launch in 2022, no medicines have yet been able to make use of the IMF for managed access.\(^{399}\)

---

\(^{397}\) Id. and PhRMA analysis of NICE recommendations and market authorizations.

PhRMA and its member companies remain concerned that the UK commercial operating environment and government pressure to ensure any changes are “cost-neutral” to the NHS is creating a zero-sum game in which methodological improvements in one area are either offset by new methodological challenges in other areas or not able to be made at all. An example of this was NICE’s decision not to change the reference case discount rate to 1.5 percent, despite a well-evidenced case for change. Overall, the NICE methods review has fallen short of much needed reforms.

PhRMA member companies recognize the UK Government’s interest in controlling health care spending, but spending on medicines has not been a driver of growing health care costs. On the contrary, in the five years up to 2019, NHS spending on the majority of branded medicines was capped to 1.1 percent growth on average per year, a decline of 0.4 percent after inflation, while total NHS spending rose at 3.3 percent over the same period. Innovations in prevention and treatment are vital to creating a more effective and resilient UK health system, as well as to improving health outcomes and providing high-quality care.

The United Kingdom invests less than other developed economies on medicines, with just 9 percent of its health care budget spent on medicines compared to an average of 15 percent among peer countries. There are a range of measures used by the NHS to manage expenditure on branded medicines, including cost-effectiveness thresholds set by NICE and a further budget impact test, as well as the VPAS. The contribution required from industry to cap the market through double-digit clawback on revenues is not sustainable and makes the United Kingdom uncompetitive. A sustainable long-term agreement is needed between industry, the UK Government and the NHS that supports the ambition of the Life Sciences Vision and promotes world-class patient outcomes, NHS financial sustainability and an innovative industry that can continue to invest in tomorrow’s treatments and cures.

Delivering on Ambitions for the Life Sciences Sector

When the UK Government was elected in 2019, it ran on an ambitious platform with goals to increase combined public and private R&D expenditure to 2.4 percent of GDP across the economy and make the United Kingdom a leading hub for life sciences. The sector forms a key pillar of the UK’s economy and this is recognized by the UK Government. In July 2021, the UK Government published the Life Sciences Vision, setting out its industrial policy for the sector. The Vision is an evolution of the 2017 Life Sciences Industrial Strategy and was developed in partnership with industry and the wider life sciences sector. The Vision sets out the broad outline of sector policy for the next five to ten years. It is focused on three themes:

- Building on the UK’s science and clinical research infrastructure and harnessing the UK’s unique genomic and health data.

---

• Supporting the NHS to test, purchase and deploy innovative technologies, so that cutting-edge science and innovations can be embedded widely across the NHS as early as possible and rapidly adopted in the rest of the world more effectively.

• Creating the right business environment in the United Kingdom in which firms can access the finance to grow, be regulated in an agile and efficient way, and manufacture and commercialize their products in the United Kingdom.

Also forming a major part of the Vision is a mission-led approach to address some of the biggest health care problems faced by the NHS, including cancer, respiratory disease and dementia. Industry was particularly pleased to see the commitment within the Vision for the NHS to be a central partner in delivering sector policy goals. Finally, there was recognition of the need for end-to-end support for the system of biomedical innovation in the Vision: this included a commitment to an ambitious outcome for the NICE Methods Review and plans to improve the uptake of innovative medicines in the NHS, which the Vision noted was an issue that needed to be addressed.

PhRMA welcomed the creation of the Life Sciences Vision; however, implementation is currently disparate across the system and reforms in some parts are stifled by lack of progress in others. Meaningful reforms to the UK commercial environment are needed for this vision to be realized.

Reinvigorating the MHRA’s Position as a World-leading Health Regulatory Body

The operational and leadership strength of the MHRA underpins many of the commitments across the Life Sciences Vision, and PhRMA members support fully resourcing the MHRA to deliver on an ambitious and sustainable agenda. PhRMA remains broadly supportive of the MHRA’s Delivery Plan for 2021-23. However, some elements of the delivery plan are behind schedule and the MHRA has struggled to perform well in key areas such as clinical trial approvals.

For the MHRA to be successful, there must be adequate and stable resources to efficiently conduct regulatory approvals. This would also help address capacity issues and speed up the regulatory process so that lifesaving treatments can reach patients in a timely manner. Beyond the MHRA, optimizing the broader regulatory environment is key to boosting UK competitiveness and speeding up patient access to new medicines. Fast MHRA approvals must also be accompanied with fast NICE assessments – a disconnect between the two will undermine the other. There is, therefore, strong interest in seeing the Innovative Licensing and Access Pathway deliver on its goals.

The MHRA’s Corporate Plan 2023-26 and Business Plan 2023-24 were published in September. Based on these plans, PhRMA members look forward to working in partnership to identify targeted action that can have the largest impact for patients and life sciences in the United Kingdom. This would help to ensure that the next Delivery Plan is designed in collaboration with industry to enhance the UK’s regulatory and clinical research environment.
PHARMACEUTICAL RESEARCH AND MANUFACTURERS OF AMERICA  
NATIONAL TRADE ESTIMATE REPORT ON FOREIGN TRADE BARRIERS 2024  

VIETNAM  

PhRMA and its member companies continue to have significant concerns regarding the predictability and sustainability of the policy environment in Vietnam, despite the Vietnam Government’s goal to attract investment in the biopharmaceutical sector. In recent years, the industry has faced regular challenges in market entry, maintenance of product circulation and sustaining product presence due to onerous administrative procedures, frequent policy changes and significant delays in regulatory approvals. Furthermore, many of the reforms proposed by the Vietnam Government are inconsistent with international obligations and best practices, and there is a lack of effective intellectual property (IP) protection and enforcement in the country.  

Key Issues of Concern:  

- **Registration of biopharmaceutical products**: Despite raising concerns through various channels, PhRMA member companies continue to experience significant regulatory delays and hurdles to obtain and maintain marketing authorization for biopharmaceutical products. The Vietnam Government has initiated the process of amending the Pharma Law to address some of these issues, but until that process is completed, these regulatory barriers could deter the introduction of new medicines to the market as well as disrupt the supply of existing medicines used to treat patients. On average, it takes four to five years for a new medicine approved in the United States or European Union to be approved for sale in Vietnam, compared to two to three years in other countries in the region. This is despite the one-year timeline stipulated by Vietnamese law.  

- **Government procurement and reimbursement**: PhRMA member companies continue to face abrupt policy changes in the area of biopharmaceutical procurement, as well as a lack of predictability in the implementation of price negotiations and reimbursement for innovative medicines. As the Vietnam Government continues to revise the Circular regulating the process for tendering in public health care establishments, it is important to ensure transparency and avoid sudden major disruptions to patient access and investment. In addition, current unpredictable procedures for updating the National Reimbursement List (NRL) add several years of delay. Overall, patients end up waiting about eight years to access new medicines in public hospitals that have been granted marketing authorization. This significantly erodes a product’s patent term. PhRMA member companies welcome dialogue with the Vietnam Government on enabling faster access to innovative medicines and identifying sustainable health care financing solutions that achieve benefits to patients, trade and investment.  

- **Intellectual property protection**: The adoption of IP protections that conform to international obligations and standards, including meaningful regulatory data protection (RDP), clarification of the scope of patentable subject matter and implementation of effective patent enforcement and restoration mechanisms, consistent with its international commitments, would greatly assist Vietnam in
creating a more predictable environment for investment in innovation and enhance transparency and predictability.

For these reasons, PhRMA requests that the U.S. Government continue to seek assurances that the problems described herein are quickly and effectively resolved including through bilateral engagement facilitated under the U.S.-Vietnam Trade and Investment Framework Agreement.

Intellectual Property Protection

Innovative pharmaceutical companies continue to face burdensome delays in the granting of patent protection in Vietnam. Furthermore, Vietnam does not provide an effective patent enforcement mechanism nor adjust the patent term to compensate for the delay in granting patent protection, thus eroding the effective term of patent protection available for innovative medicines. Likewise, despite the significant delays in the marketing authorization process, Vietnam does not provide a patent term restoration (PTR) mechanism to restore a portion of patent life lost during the lengthy regulatory development and approval process.

While amendments to the IP Law in 2022 were intended to address these deficiencies and implement Vietnam’s international commitments, early indications are that the revisions are woefully inadequate. For example, Article 131a to the Amended IP Law was intended to provide a PTR mechanism in Vietnam, consistent with its commitments in the European Union-Vietnam Free Trade Agreement. Instead, however, of providing a mechanism to restore a portion of the lost patent life, Article 131a merely relieves the patent holder of paying the patent fees during the lost patent term. Similarly, while Article 128 was amended to provide some notice to a patent holder that a generic is seeking marketing approval during the patent term, there appear to be no corresponding mechanisms to ensure parties are afforded a meaningful opportunity to resolve such patent disputes before potentially infringing pharmaceutical products are launched on the market, as required by Article 18.53 of the Comprehensive and Progressive Agreement for Trans-Pacific Partnership. This combined with new mechanisms to allow for third party observations and pre-grant opposition to a patent application (in addition to the existing opportunities to oppose the patent after it is granted) raise significant concerns about Vietnam’s commitment to protect and enforce IP rights.

In addition, as part of the implementation of Vietnam’s obligations under TRIPS, the Data Protection Circular (Circular 05/2010/TT-BYT) provides, on paper, for five years of RDP. In practice, however, this protection has proved illusory. The Circular is not clear on whether the five-year term of RDP applies in cases that involve a generic manufacturer relying on or referencing innovator data in support of its marketing approval application. Furthermore, the Circular conditions RDP on requirements that: (1) member companies submit a separate application for data protection, rather than receive automatic protection upon marketing approval as international standards and TRIPS require; (2) the application be filed within 12 months of global first approval; (3)

264
data be classified as a “trade secret” under Vietnamese law, which as defined may not cover undisclosed confidential business information; and (4) the innovator prove “ownership” of the data in cases of dispute rather than the third party or government challenger. Finally, RDP is granted at the sole discretion of the Drug Administration of Vietnam; as a result, RDP is rarely granted in Vietnam.

The adoption of a strong patent enforcement system, automatic RDP and other intellectual property protections that conform to international standards, would create a more predictable environment for investment, promote innovation and enhance Vietnam’s health care system.

**Market Access**

**Registration of Biopharmaceutical Products**

PhRMA member companies continue to experience significant delays and regulatory hurdles to obtain and maintain marketing authorization for biopharmaceutical products. Several administrative barriers to market access remain in place, in particular the Certificate of Pharmaceutical Product (CPP) requirements. To register for marketing authorization in Vietnam, companies are required under Circular 08/2022/TT-BYT to submit a CPP from the country of origin or certain reference countries with their technical dossiers. Regulatory authorities worldwide, including the U.S. Food and Drug Administration (FDA), have recognized and adopted the WHO Certification scheme when granting CPPs. While Vietnam has through the adoption of Circular 08/2022/TT-BYT moved toward adopting the WHO Certification scheme, several additional requirements remain that create administrative barriers. In addition, Vietnam contacts the CPP-issuing authority to verify the authenticity of the CPP submitted by the company, which adds significant administrative burden. These requirements do not address Vietnam’s concerns about fraudulent dossiers and counterfeit medicines and result in delays and entry barriers for new medicines. Translation and online submission requirements further prolong the regulatory review timelines. If not addressed, these regulatory barriers will continue to delay and even deter introduction of new medicines to Vietnam, as well as the supply of existing medicines used to treat patients.

Under the existing Pharma Law, marketing authorizations must be renewed every five years through a cumbersome administrative process. As a result, renewals are rarely granted in time, such that companies have had to build significant inventories to bridge anticipated supply gaps. Recognizing the problem, the Vietnam Government has this year issued a Resolution (No. 80) extending more than 10,000 marketing authorizations through to December 31, 2024, to enable the continued importation, public procurement and stable supply of medicines. To avoid supply disruptions, industry is requesting a further extension of marketing authorization validity until the Pharma Law is revised and becomes effective. Furthermore, PhRMA and its member companies recommend that Vietnam apply regulatory reliance where applicable to utilize the assessments completed by stringent regulatory authorities to expedite the approval of innovative medicines, and remove the renewal procedure (or at least grant automatic
renewals) to ensure marketing authorizations remain valid throughout a product’s lifecycle instead of being subject to renewal every five years. It is crucial for the Vietnam National Assembly and Government to urgently address this issue to enable a stable supply of medicines.

Government Procurement

To its credit, Vietnam has rapidly increased social health insurance coverage, with 90 percent of the population covered in 2021. At the same time, Vietnamese patients still have very limited and slow access to innovative medicines compared to other countries. Recognizing, therefore, that future health care demand is likely to increase significantly and that public procurement of medicines currently accounts for more than two-thirds of the total biopharmaceutical market by value, the Vietnam Government will need innovative and sustainable health financing solutions. Moreover, any decisions related to government procurement have a significant impact on quality of care, product supply and patient access.

PhRMA members have been advocating to maintain regulations for the procurement of medicines in public hospitals, under which all brand name products, both on- and off-patent, will be able to negotiate prices. If conducted following the principles of sustainability (in terms of the magnitude and frequency of price adjustments) and predictability (in terms of the process and criteria for negotiation), such price negotiations could be a win-win solution that allows patients to access existing and new medicines, ensures continuity in treatment and enables a more predictable environment for PhRMA member companies to bring new products to Vietnam. As the Vietnam Government continues to revise the Circular regulating the process for tendering in public health care establishments, it is important to ensure transparency and avoid sudden major disruptions to patient access and the investment environment.

Finally, there is need to develop a legal framework that does not limit the tendering of products paid by a facility’s commercial operations based on the products paid by government funds. This ultimately results in reduced choice of treatment options for patients and physicians in Vietnam.

Government Reimbursement

Overall, just nine percent of new medicines launched globally since 2012 are available in Vietnam, with Vietnamese patients waiting an average of 47 months from global first launch for the fewer medicines that become available. However, under current practice, once a biopharmaceutical product is granted marketing authorization, it still needs to be added to the NRL before patients can access that product through the public health insurance system. The NRL is only reviewed every three to four years, during which time no new information or newly licensed products can be considered for reimbursement. Patients end up waiting about eight years to access new medicines in

---

public hospitals that have already been granted marketing authorization. In addition, because of these delays, a product’s patents may have expired or be close to expiring by the time that they are launched in Vietnam.

To ensure early access to new innovative medicines in Vietnam, the NRL should be reviewed and updated frequently, either through continuous inclusion following marketing authorization in Vietnam or at least every year. Furthermore, products approved by stringent regulatory authorities such as the U.S. FDA should be automatically eligible for reimbursement as soon as they are granted marketing authorization in Vietnam. Finally, we recommend enabling the industry to play a more proactive role in the NRL review process, including allowing companies to directly submit proposals for drugs to be included in the NRL.
